2550 Intro to cybersecurity

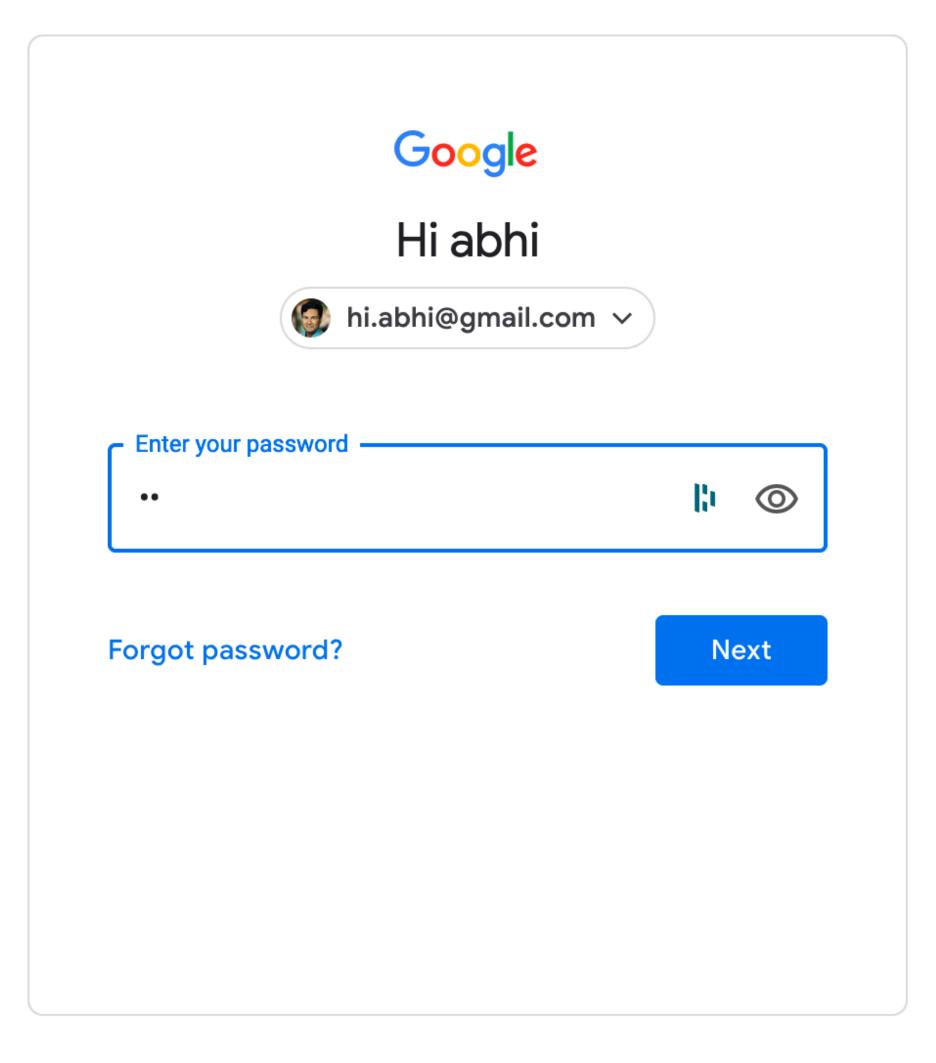

4

Password Storage Summary

- 1. Never store passwords in plain text
- 2. Always salt and hash passwords before storing them
- 3. Use hash functions with a high work factor
- 4. Implement honeywords to detect breaches

- These rules apply to any system that needs to authenticate users
 - Operating systems, websites, etc.

Still one problem?

English (United States) ▼

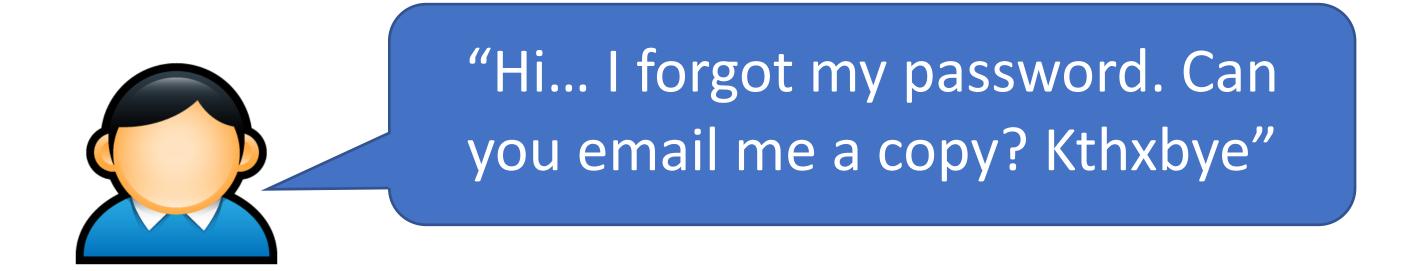

Help

Privacy

Terms

Password Recovery/Reset

Problem: hashed passwords cannot be recovered (hopefully)

- This is why systems typically implement password reset
 - Use out-of-band info to authenticate the user
 - Overwrite hash(old_pw) with hash(new_pw)
- Be careful: its possible to crack password reset

- Typical implementations use Knowledge Based Authentication (KBA)
 - What was your mother's maiden name?
 - What was your prior street address?
 - Where did you go to elementary school

- Typical implementations use Knowledge Based Authentication (KBA)
 - What was your mother's maiden name?
 - What was your prior street address?
 - Where did you go to elementary school
- Problems?

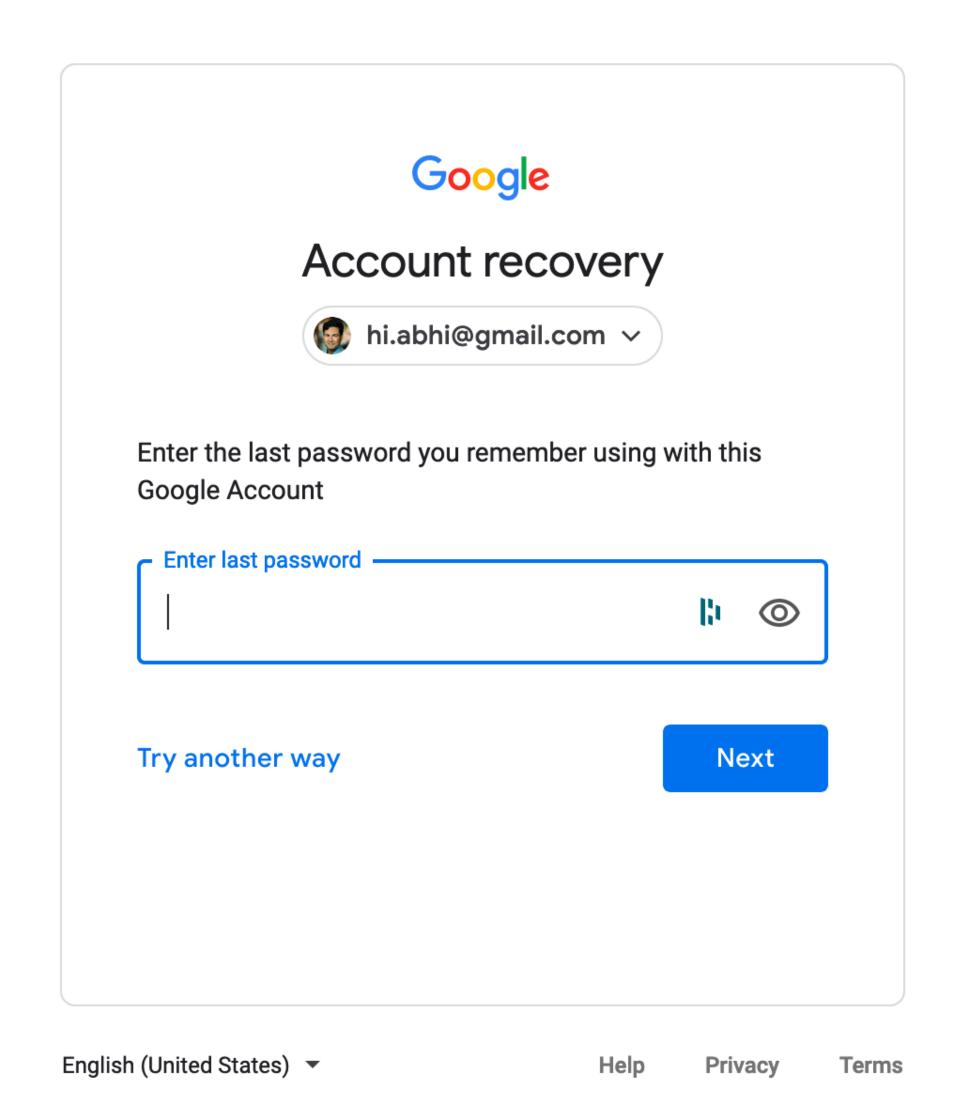

- Typical implementations use Knowledge Based Authentication (KBA)
 - What was your mother's maiden name?
 - What was your prior street address?
 - Where did you go to elementary school

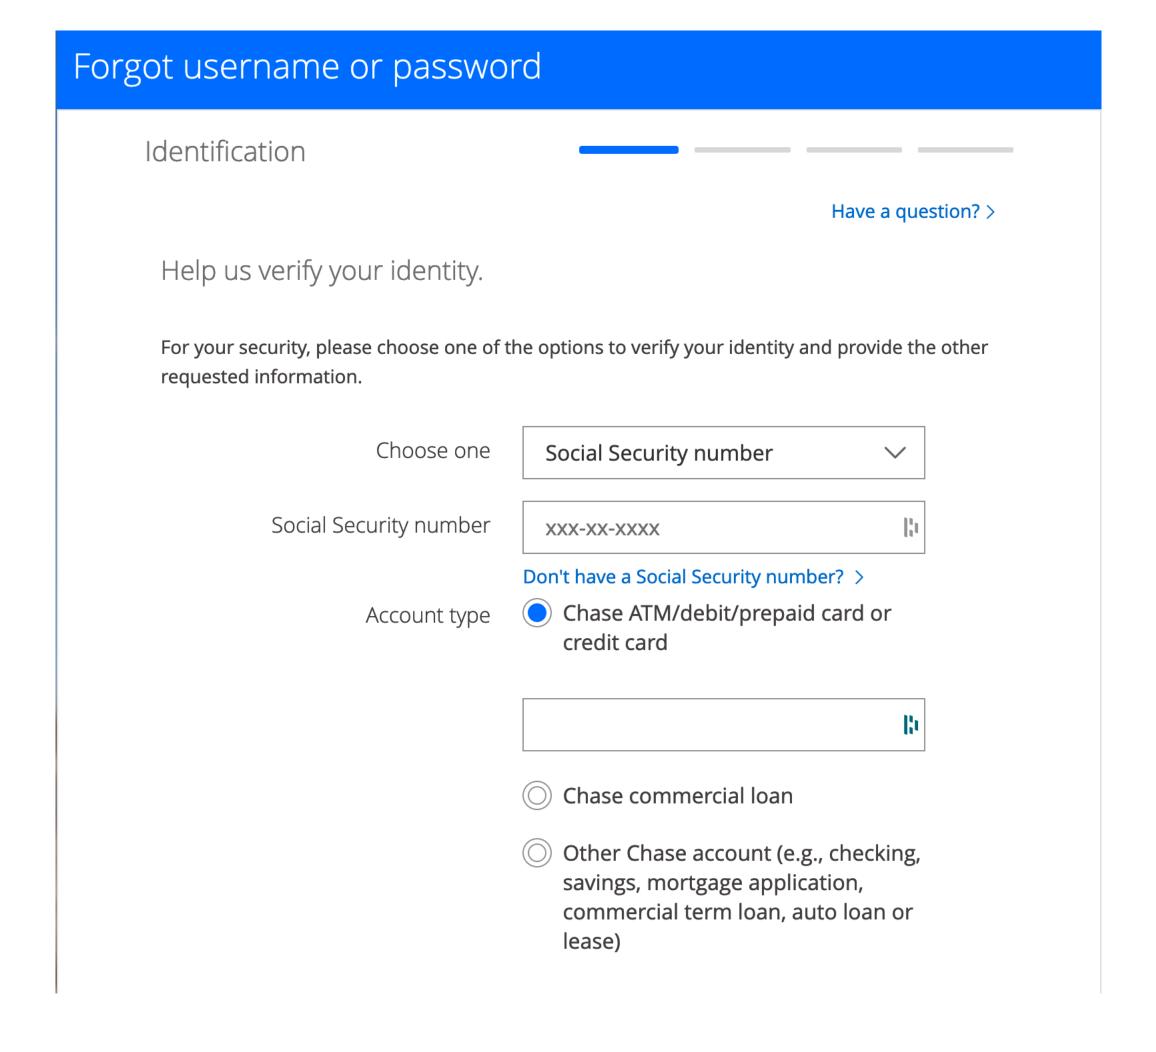

Problems?

- This information is widely available to anyone
- Publicly accessible social network profiles
- Background-check services like Spokeo

- Typical implementations use Knowledge Based Authentication (KBA)
 - What was your mother's maiden name?
 - What was your prior street address?
 - Where did you go to elementary school
- Problems?
 - This information is widely available to anyone
 - Publicly accessible social network profiles
 - Background-check services like Spokeo
- Experts recommend that services not use KBA
 - When asked, users should generate random answers to these questions

Other roots of identity

Choosing Passwords

Bad Algorithms

Better Heuristics

Password Reuse

Password Reuse

- People have difficulty remembering >4 passwords
 - Thus, people tend to reuse passwords across services
 - What happens if any one of these services is compromised?
- Service-specific passwords are a beneficial form of compartmentalization
 - Limits the damage when one service is inevitably breaches
- Use a password manager
- Some service providers now check for password reuse
 - Forbid users from selecting passwords that have appeared in leaks

Two Factor Authentication

Biometrics

SMS

Authentication Codes

Smartcards & Hardware Tokens

Types of Secrets

- Actors provide their secret to log-in to a system
- Three classes of secrets:
 - 1. Something you know
 - Example: a password
 - 2. Something you have
 - Examples: a smart card or smart phone
 - 3. Something you are
 - Examples: fingerprint, voice scan, iris scan

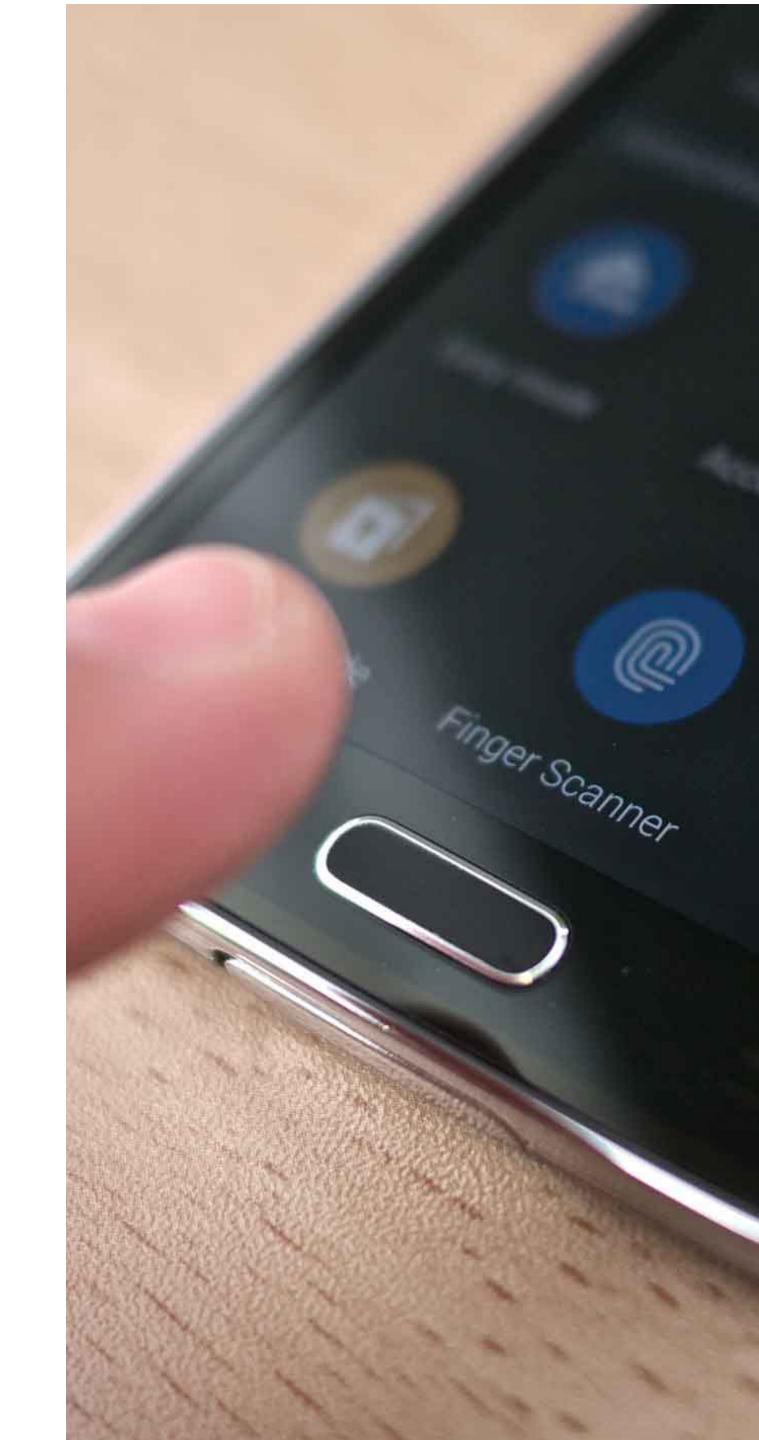

Biometrics

- ancient Greek: bios ="life", metron ="measure"
- Physical features
 - Fingerprints
 - Face recognition
 - Retinal and iris scans
 - Hand geometry
- Behavioral characteristics
 - Handwriting recognition
 - Voice recognition
 - Typing cadence
 - Gait

Fingerprints

- Ubiquitous on modern smartphones, some laptops
- Secure?
 - May be subpoenaed by law enforcement
 - Relatively easy to compromise
 - 1. Pick up a latent fingerprint (e.g. off a glass) using tape or glue
 - 2. Photograph and enhance the fingerprint
 - 3. Etch the print into gelatin backed by a conductor
 - 4. Profit;)

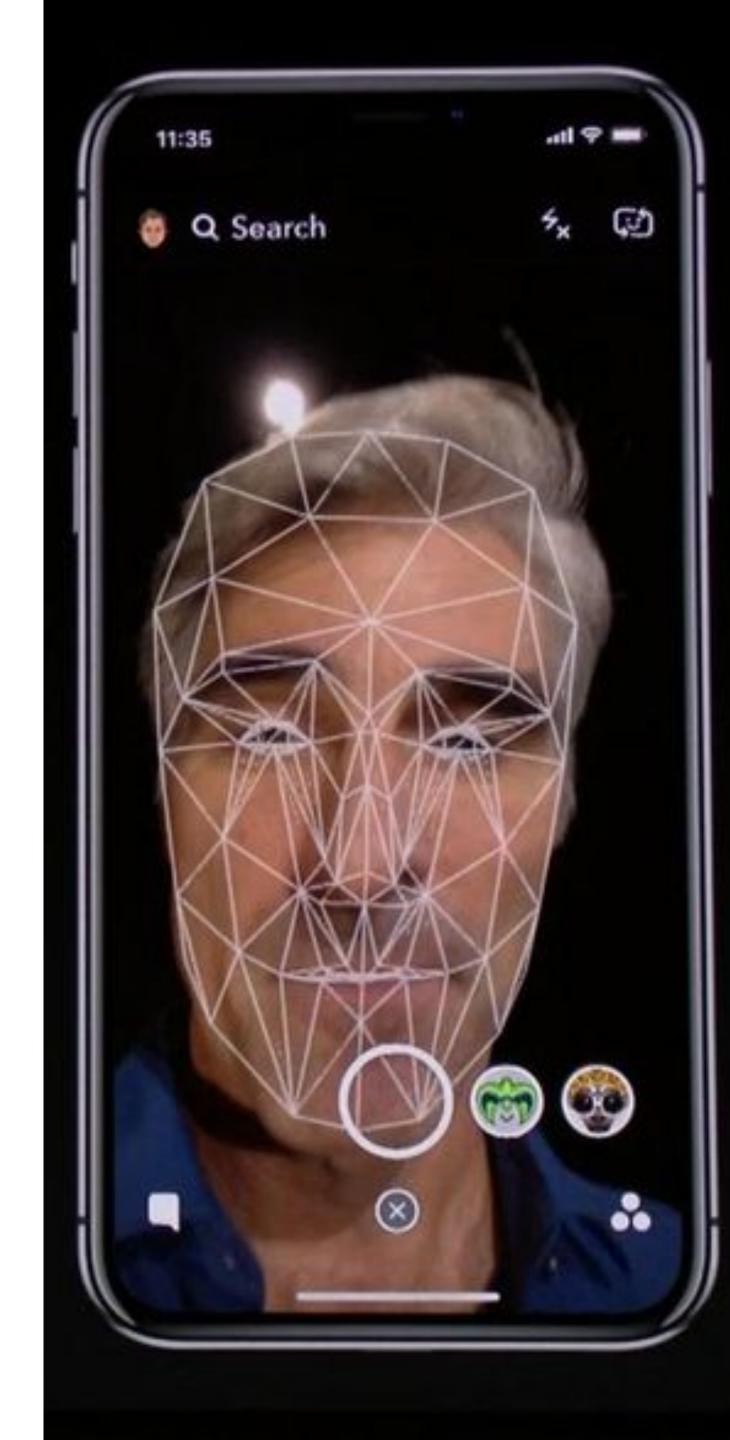

https://www.theregister.co.uk/2002/05/16/gummi_bears_defeat_fingerprint_sensors/

- Popularized by FaceID on the iPhone X

Google has confirmed the Face Unlock system on its new Pixel 4 smartphone can allow access to the device even when the user has their eyes closed.

Early testers of the phone, as well as security experts, have raised concerns it could lead to unauthorised access to the device.

It has been suggested someone else could gain access to the phone by holding it in front of the face of its sleeping owner, but Google said it meets security requirements.

The technology giant unveiled the new phone earlier this week.

In a statement, Google said: "Pixel 4 Face Unlock meets the security requirements as a strong biometric and can be used for payments and app authentication, including banking apps.

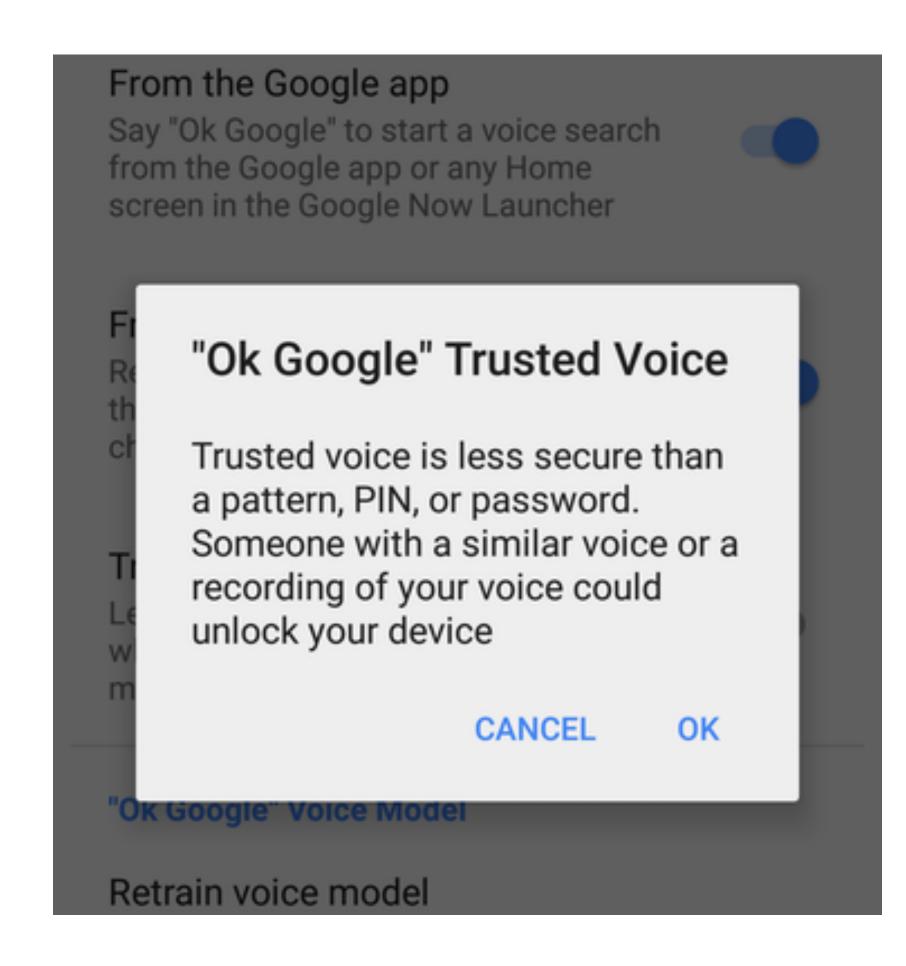

"It is resilient against unlock attempts via other means, like with masks.

"If you want to temporarily disable Face Unlock, you can use lockdown mode to temporarily require a PIN/pattern/password.

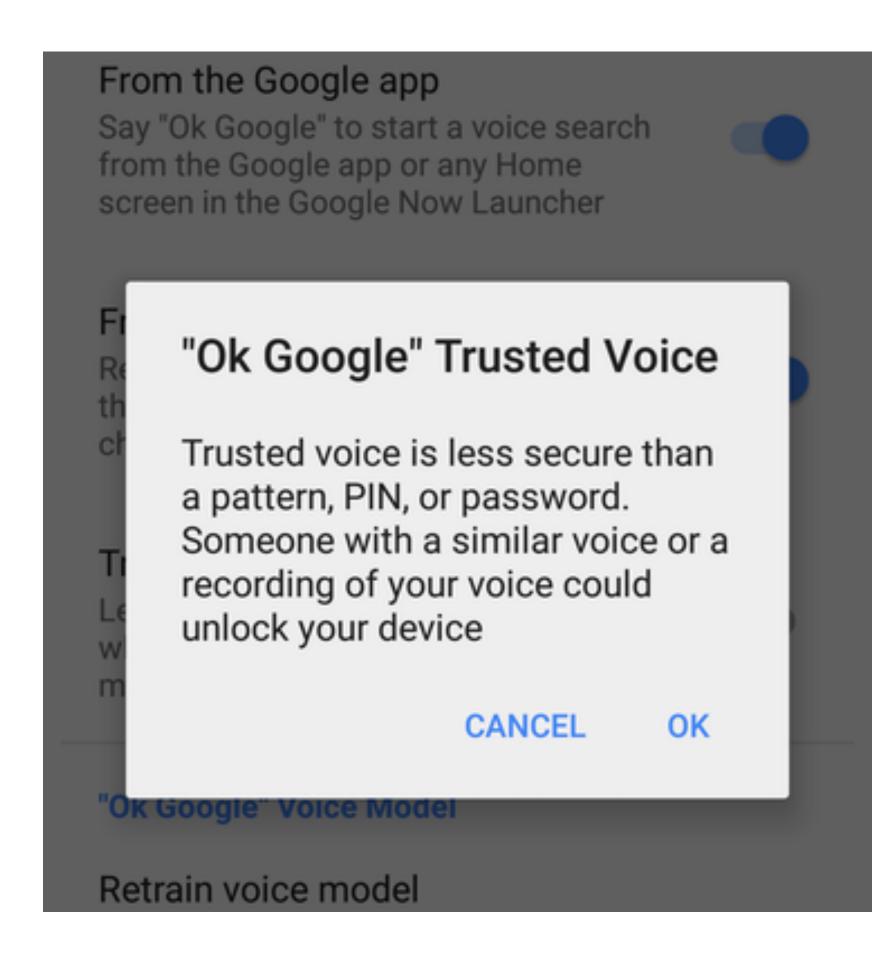

- Secure?
 - Very much depends on the implementation

- Secure?
 - Very much depends on the implementation
- Some systems ask you to record a static phrase
 - E.g. say "unlock" to unlock
 - This is wildly insecure
 - Attacker can record and replay your voice

- Secure?
 - Very much depends on the implementation
- Some systems ask you to record a static phrase
 - E.g. say "unlock" to unlock
 - This is wildly insecure
 - Attacker can record and replay your voice

- Secure?
 - Very much depends on the implementation
- Some systems ask you to record a static phrase
 - E.g. say "unlock" to unlock
 - This is wildly insecure
 - Attacker can record and replay your voice
- Others ask you to train a model of your voice
 - Train the system by speaking several sentences
 - To authenticate, speak several randomly chosen words
 - Not vulnerable to trivial replay attacks, but still vulnerable
 - Given enough samples of your voice, an attacker can train a synthetic voice AI that sounds just like you

Fundamental Issue With Biometrics

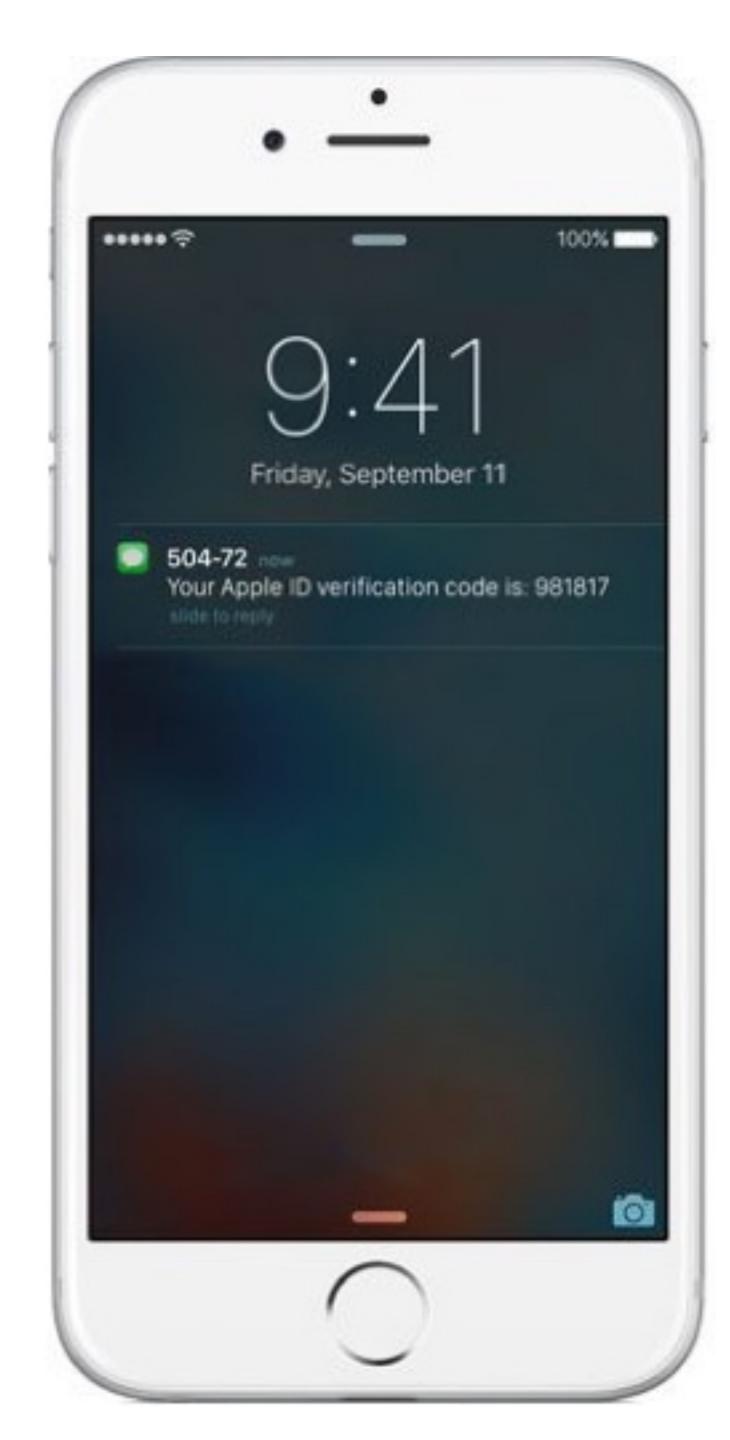

- Biometrics are immutable
 - You are the password, and you can't change
 - Unless you plan on undergoing plastic surgery?
- Once compromised, there is no reset
 - Passwords and tokens can be changed
- Example: the Office of Personnel Management (OPM) breach
 - US gov agency responsible for background checks
 - Had fingerprint records of all people with security clearance
 - Breached by China in 2015, all records stolen:(

Something You Have

- Two-factor authentication has become more commonplace
- Possible second factors:
 - SMS passcodes
 - Time-based one time passwords
 - Hardware tokens

SMS Two Factor

- Relies on your phone number as the second factor
 - Key assumption: only your phone should receive SMS sent to your number

SMS Two Factor

- Relies on your phone number as the second factor
 - Key assumption: only your phone should receive SMS sent to your number
- SMS two factor is deprecated. Why?

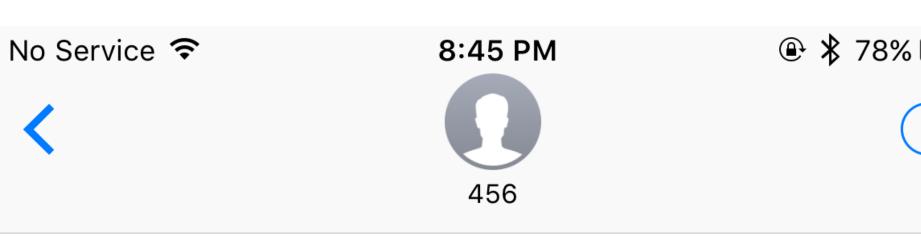

SMS Two Factor

- Relies on your phone number as the second factor
 - Key assumption: only your phone should receive SMS sent to your number
- SMS two factor is deprecated. Why?
- Social engineering the phone company
 - 1. Call and pretend to be the victim
 - 2. Say "I got a new SIM, please activate it"
 - 3. If successful, phone calls and SMS are now sent to your SIM in your phone, instead of the victim
- Not hypothetical: successfully used against many victims

First, criminals call a cell phone carrier's tech support number pretending to be their target. They explain to the company's employee that they "lost" their SIM card, requesting their phone number be transferred, or ported, to a new SIM card that the hackers themselves already own. With a bit of social engineering—perhaps by providing the victim's Social Security Number or home address (which is often available from one of the many data breaches that have happened in the last few years)—the criminals convince the employee that they really are who they claim to be, at which point the employee ports the phone number to the new SIM card.

Text Message Today 8:38 PM

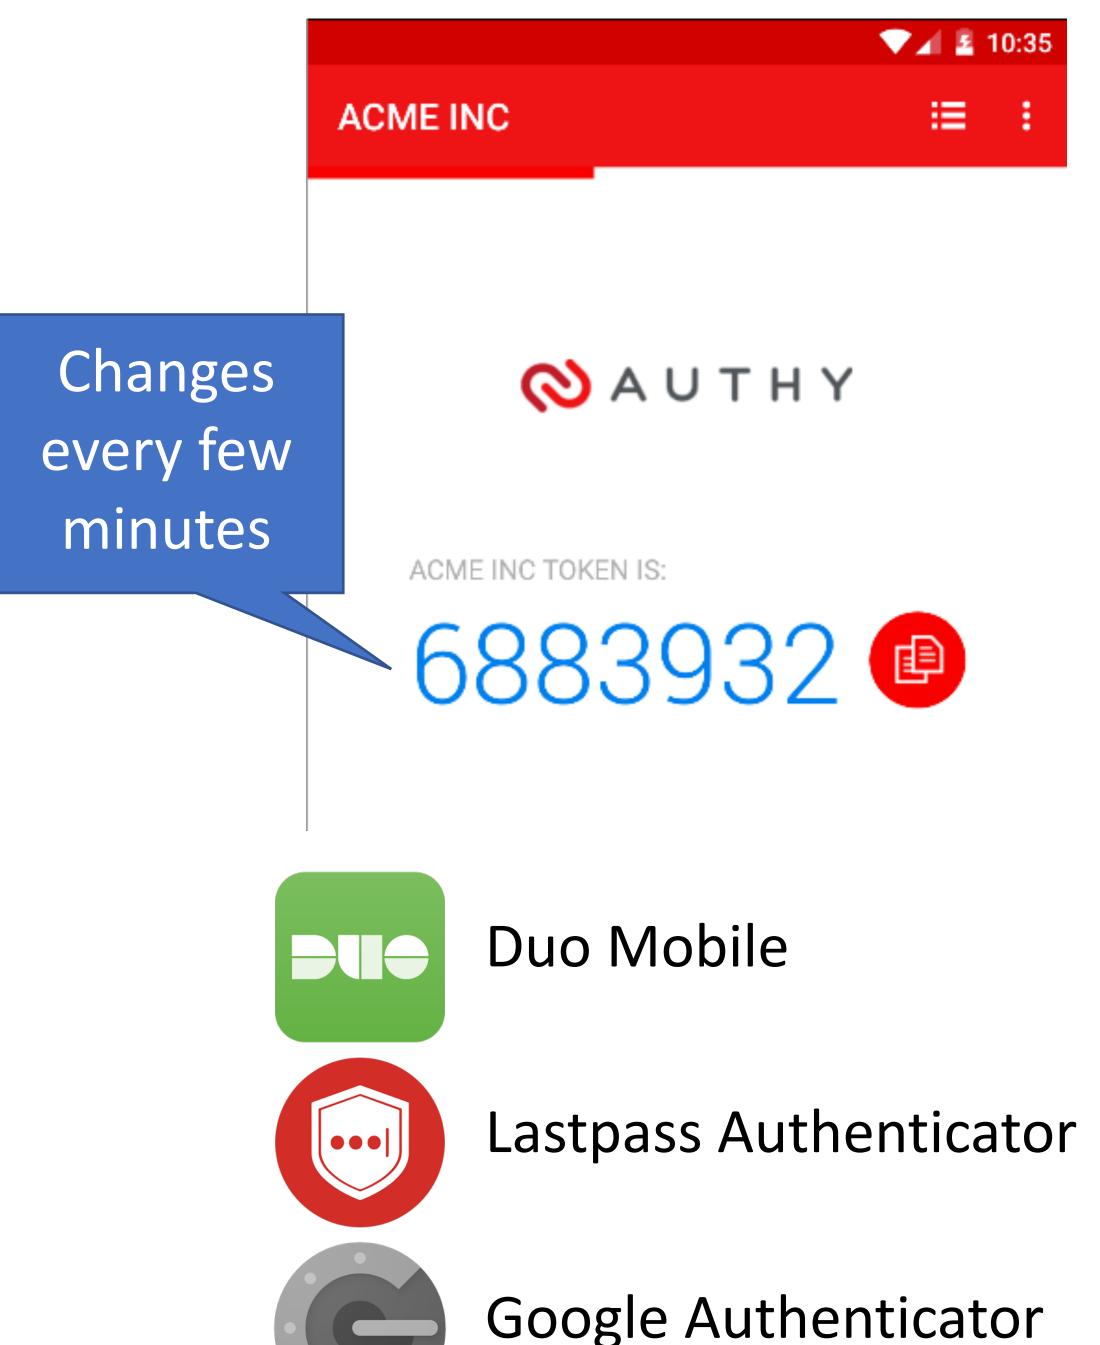

Game over.

"With someone's phone number," a hacker who does SIM swapping told me, "you can get into every account they own within minutes and they can't do anything about it." Free T-Mobile Msg: The SIM card for has been updated.

Account activity details at my.t-mobile.com. Call 1-800-937-8997 if change is unauthorized.

One Time Passwords

- Generate ephemeral passcodes that change over time
- To login, supply normal password and the current one time password
- Relies on a shared secret between your mobile device and the service provider
 - Shared secret allows both parties to know the current one time password

Time-based One-time Password Algorithm

TO = <the beginning of time, typically Thursday, 1 January 1970 UTC>
TI = <length of time the password should be valid>

K = <shared secret key>

d =<the desired number of digits in the password>

TC = floor((unixtime(now) - unixtime(TO)) / TI),

TOTP = HMAC(K, TC) % 10^d

Specially formatted SHA1-based signature

Time-based One-time Password Algorithm

TO = <the beginning of time, typically Thursday, 1 January 1970 UTC>

TI = <length of time the password should be valid>

K = <shared secret key>

d =<the desired number of digits in the password>

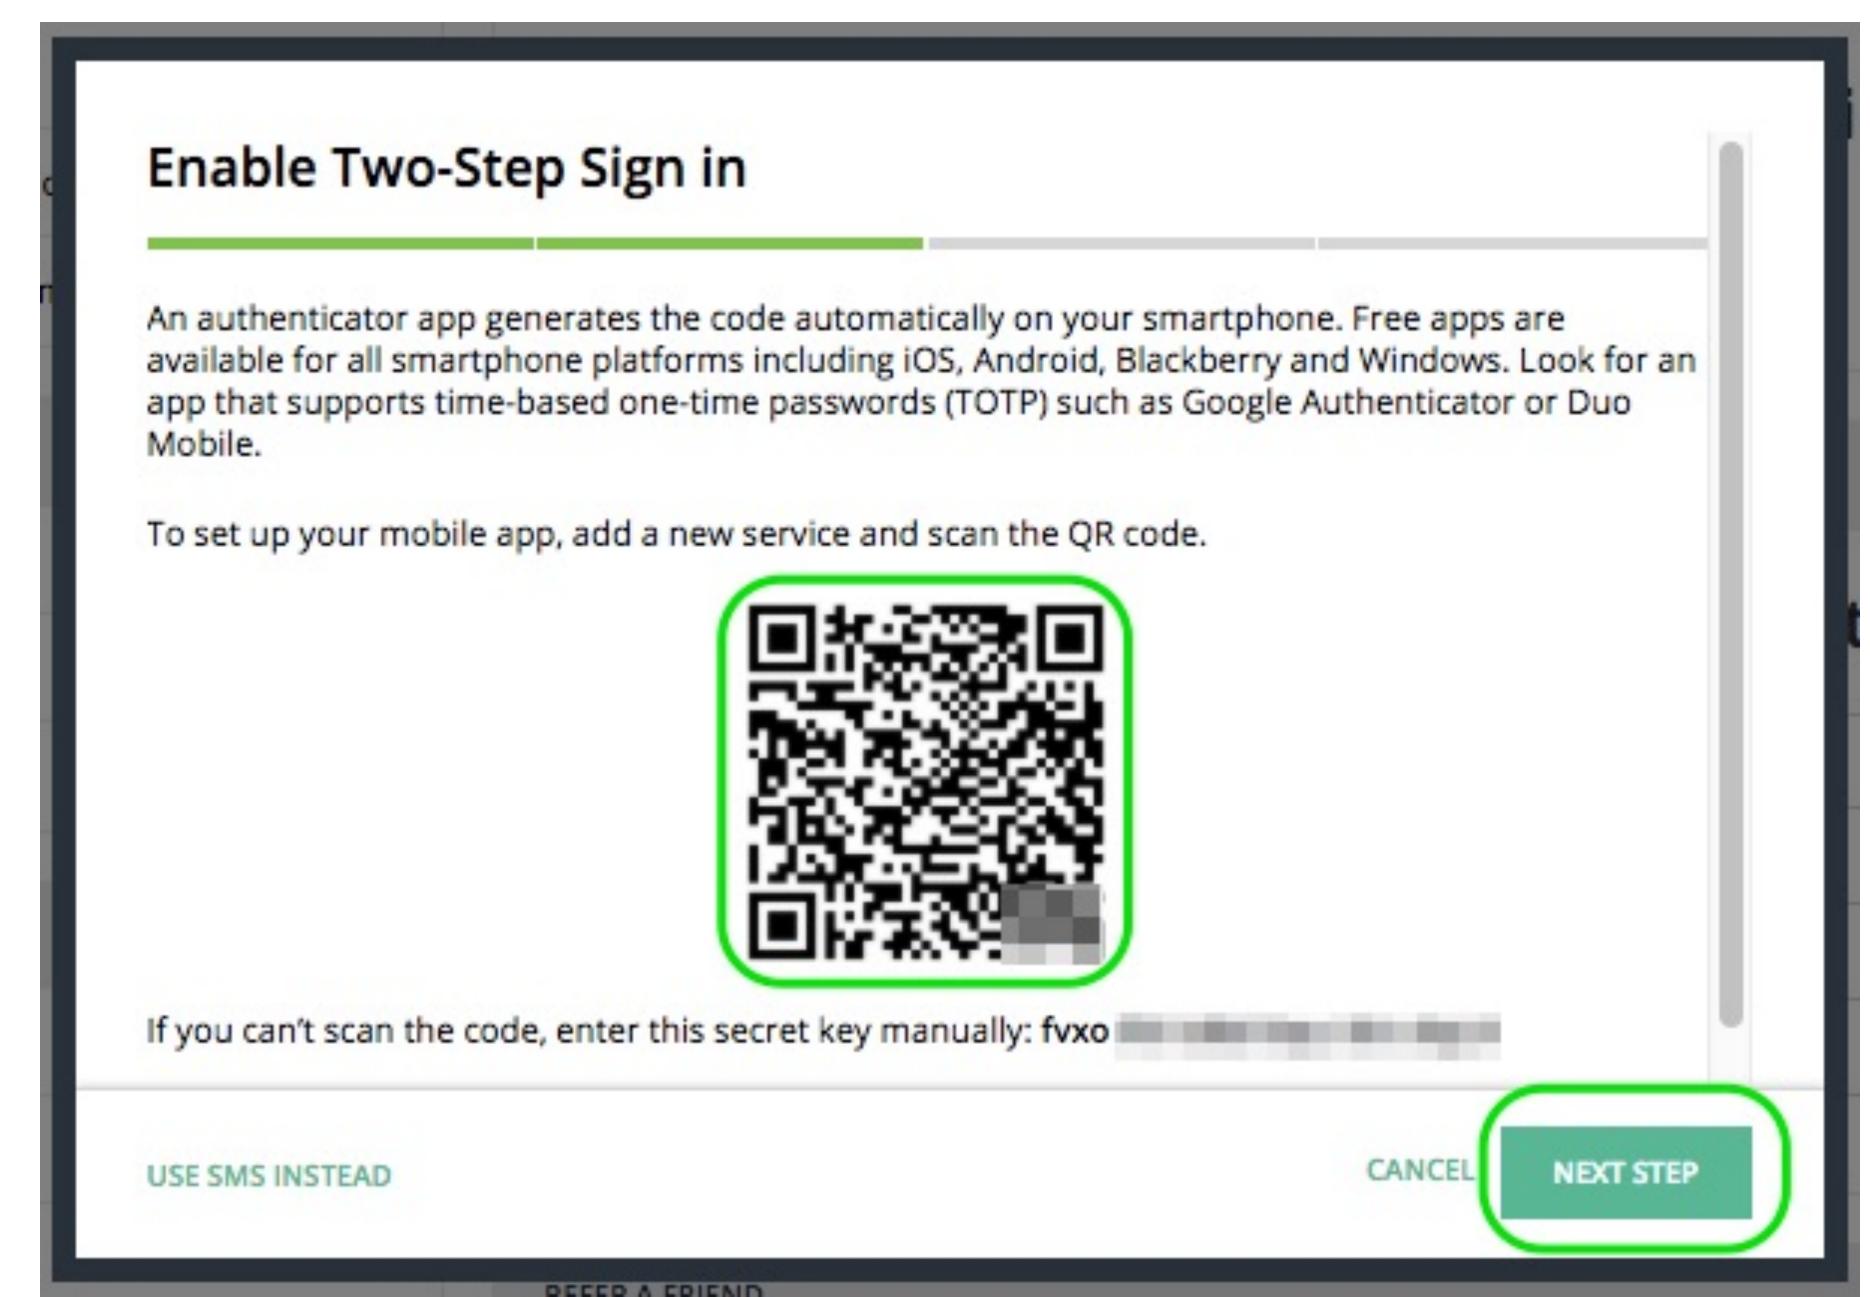

TC = floor((unixtime(now) - unixtime(TO)) / TI),

TOTP = HMAC(K, TC) % 10^d

Specially formatted SHA1-based signature

Given *K*, this algorithm can be run on your phone and by the service provider

Secret Sharing for TOTP

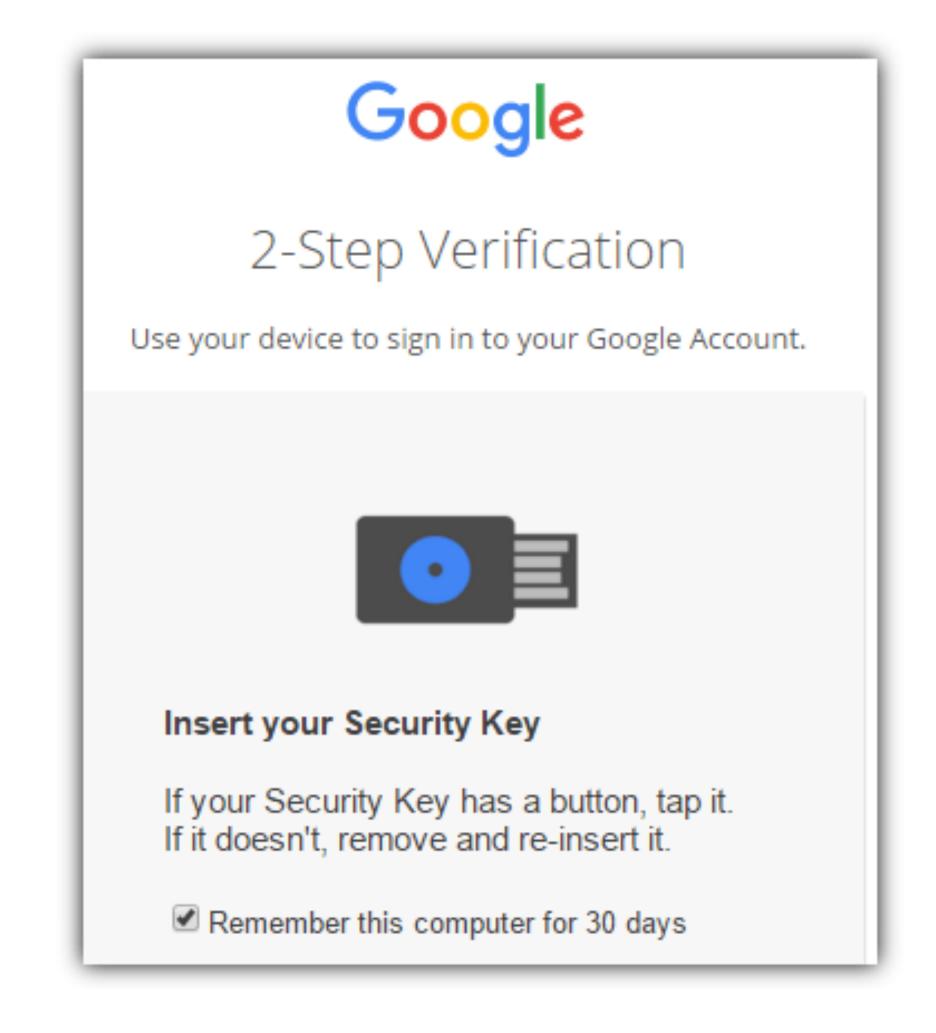

Hardware Two Factor

- Special hardware designed to hold cryptographic keys
- Physically resistant to key extraction attacks
 - E.g. scanning tunneling electron microscopes
- Uses:
 - 2nd factor for OS log-on
 - 2nd factor for some online services
 - Storage of PGP and SSH keys

Universal 2nd Factor (U2F)

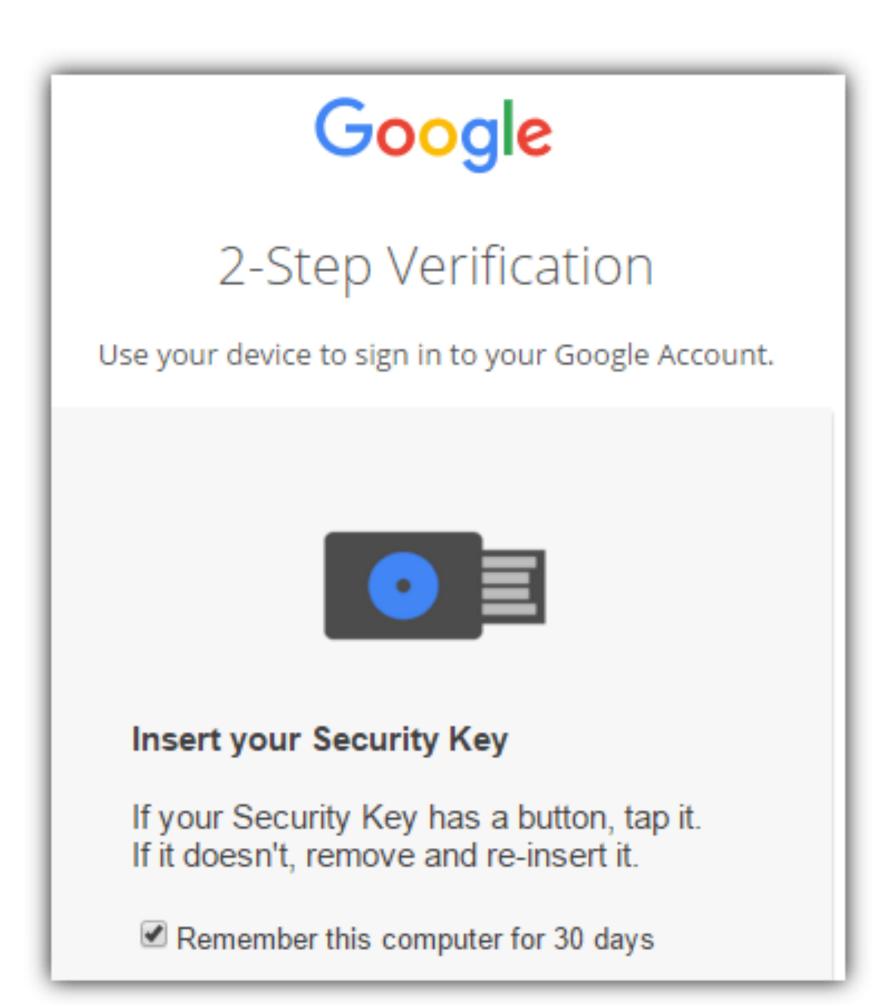

- Supported by Chrome, Opera, and Firefox (must be manually enabled)
- Works with Google, Dropbox, Facebook, Github, Gitlab, etc.

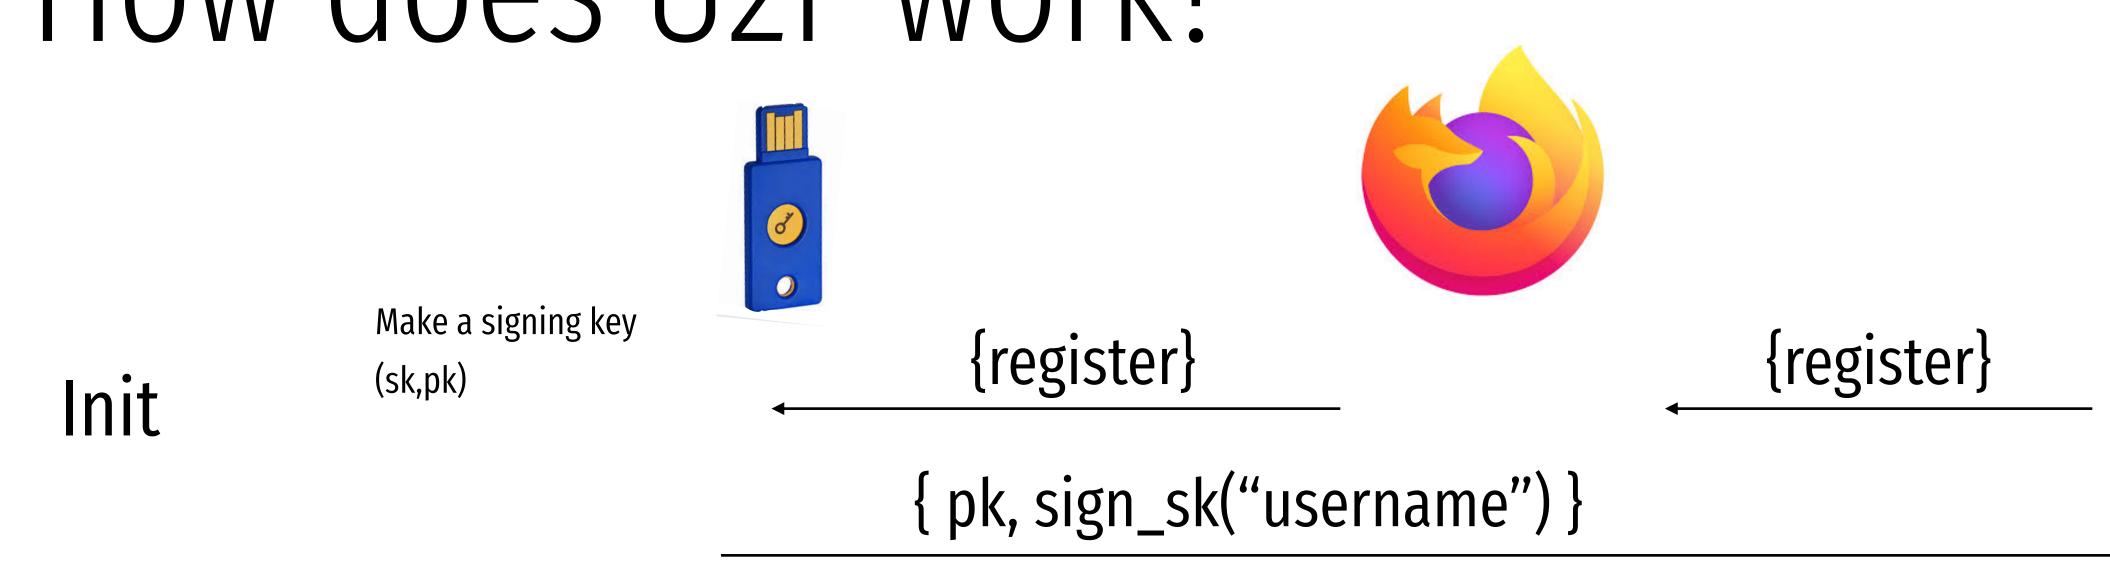

Universal 2nd Factor (U2F)

- Supported by Chrome, Opera, and Firefox (must be manually enabled)
- Works with Google, Dropbox, Facebook, Github, Gitlab, etc.

- Pro tip: always buy 2 security keys
 - Associate both with your accounts
 - Keep one locked in a safe, in case you lose your primary key;)

How does U2F work?

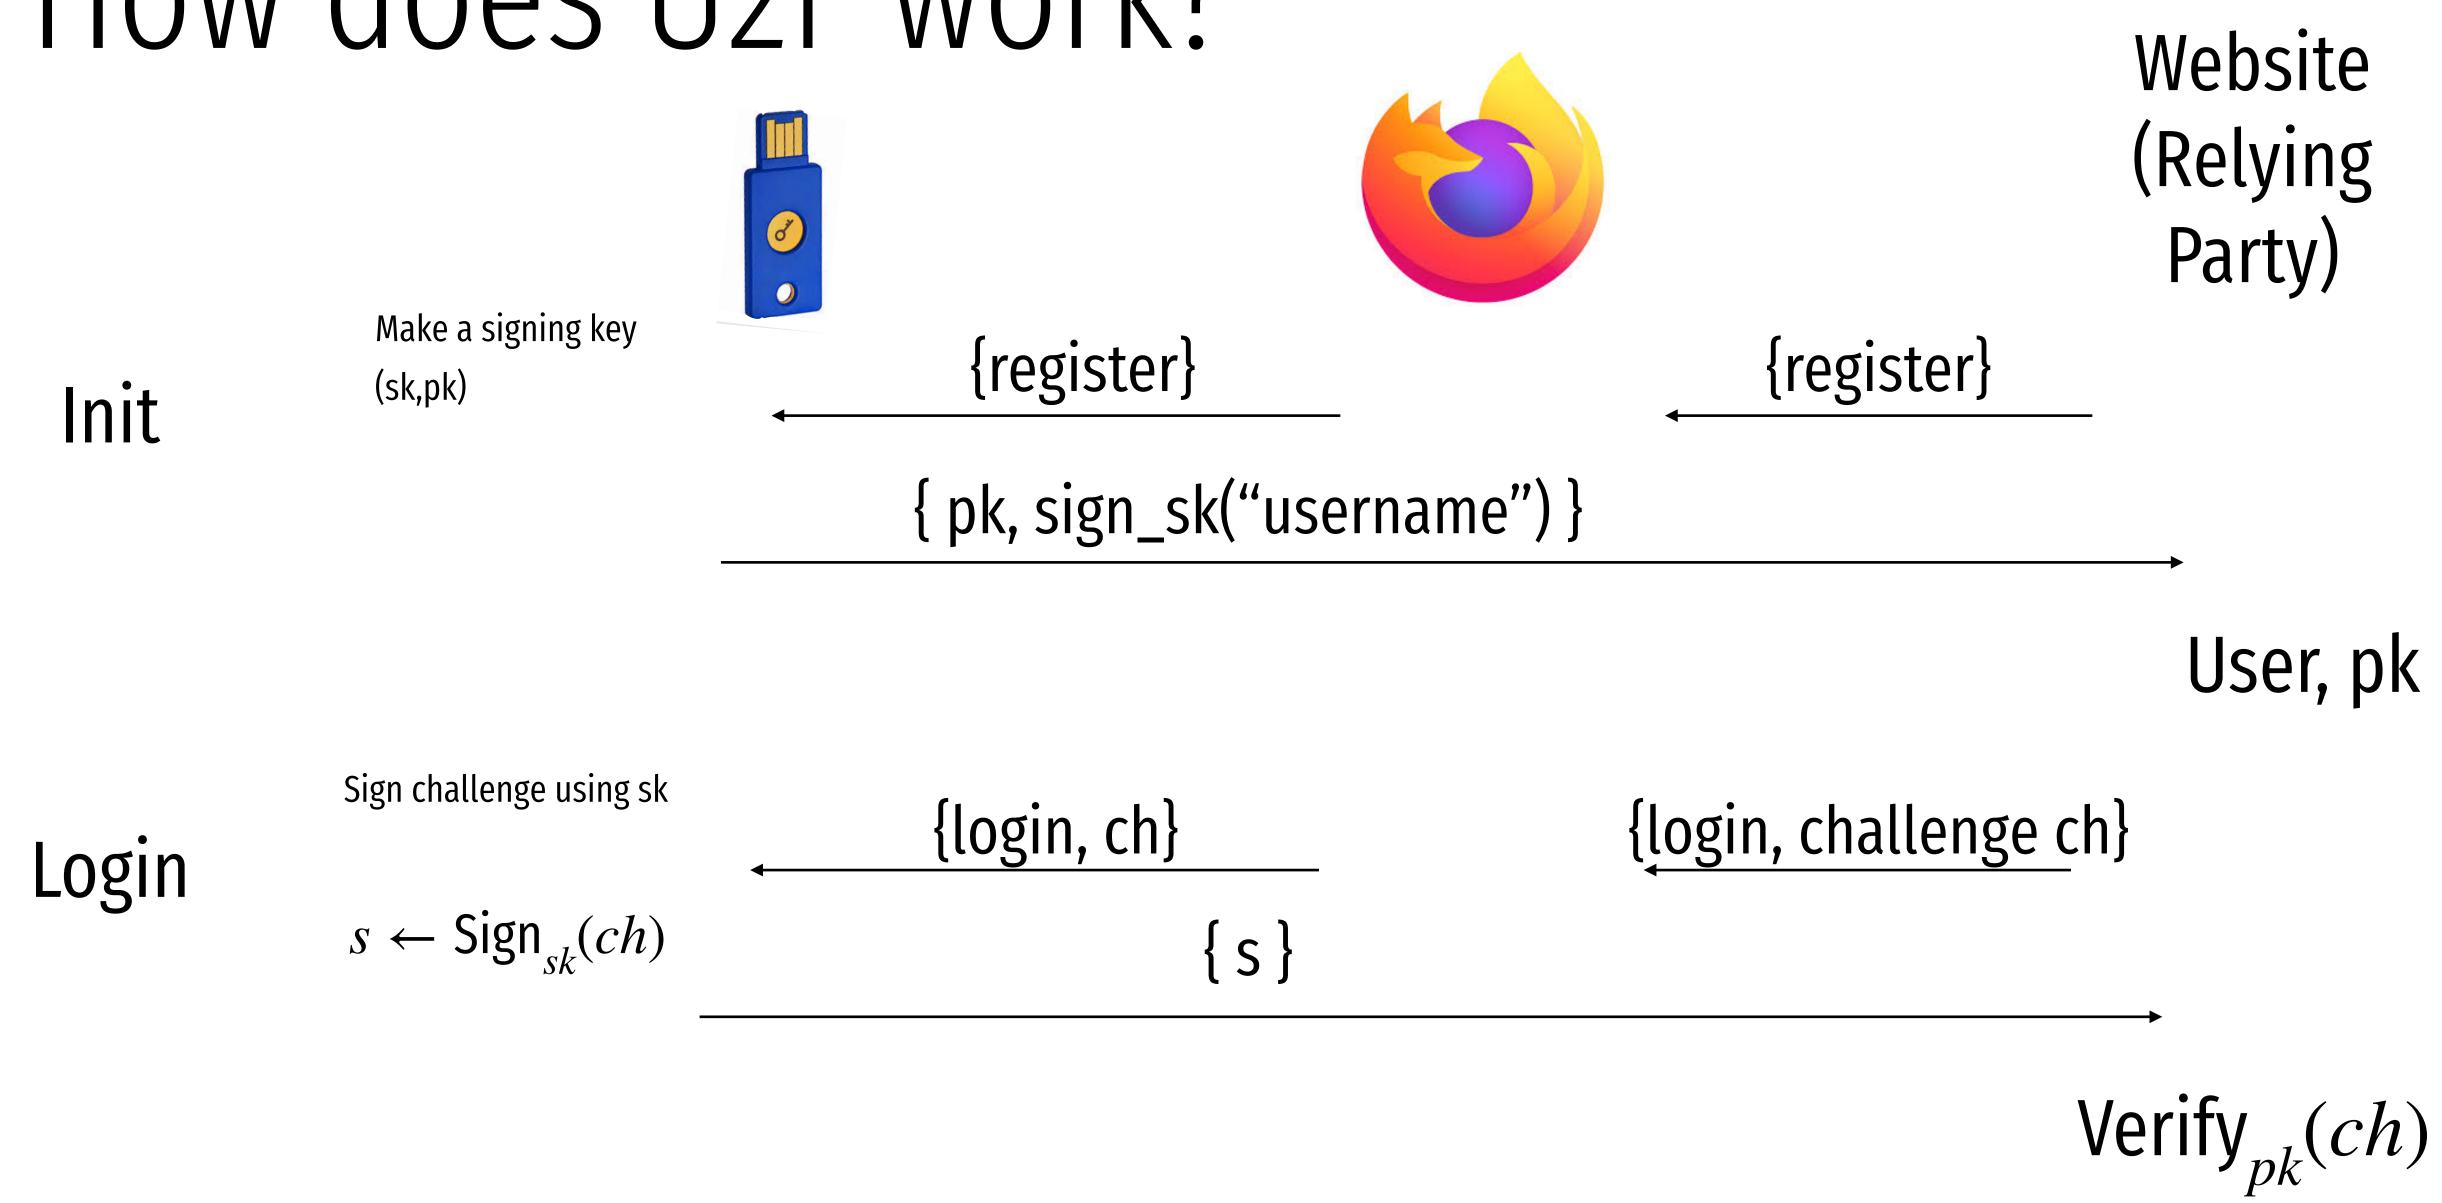

User, pk

Website

(Relying

Party)

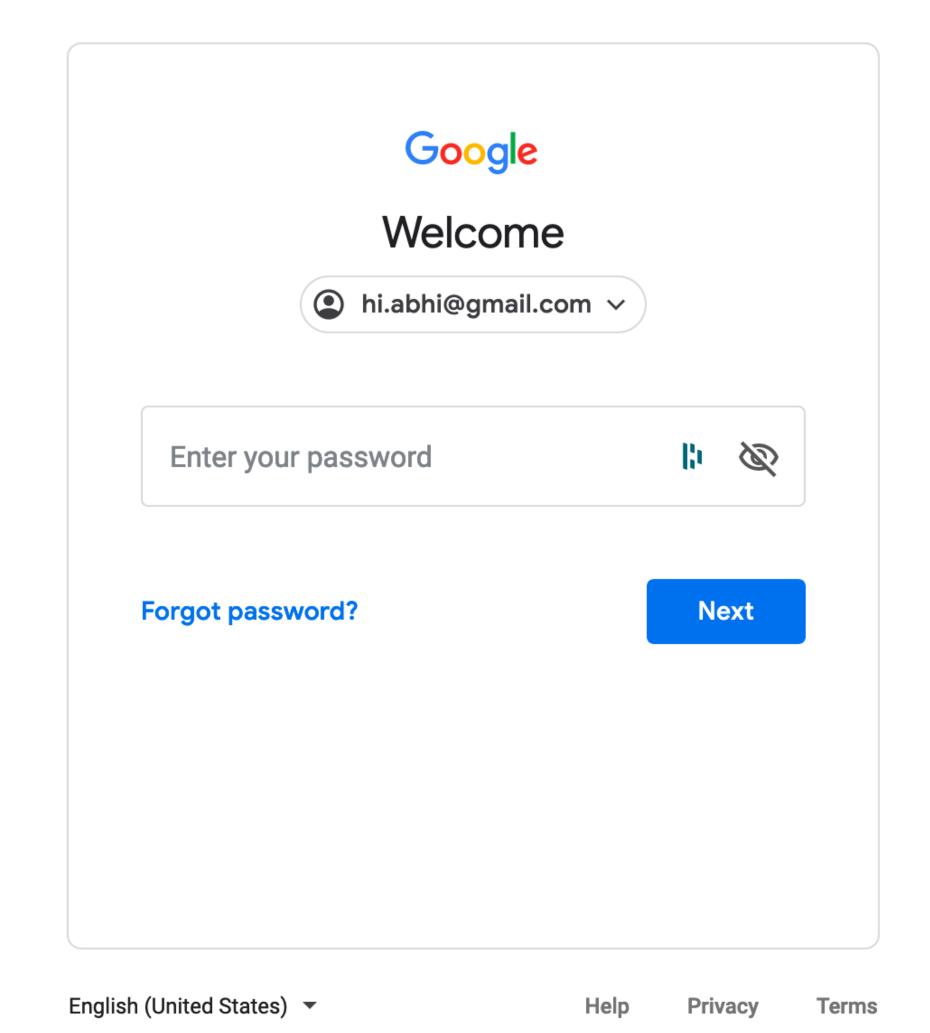

How does U2F work?

Vulnerable to simple attack

Lets work out in class how this protocol can fail. (hint: see next slide)

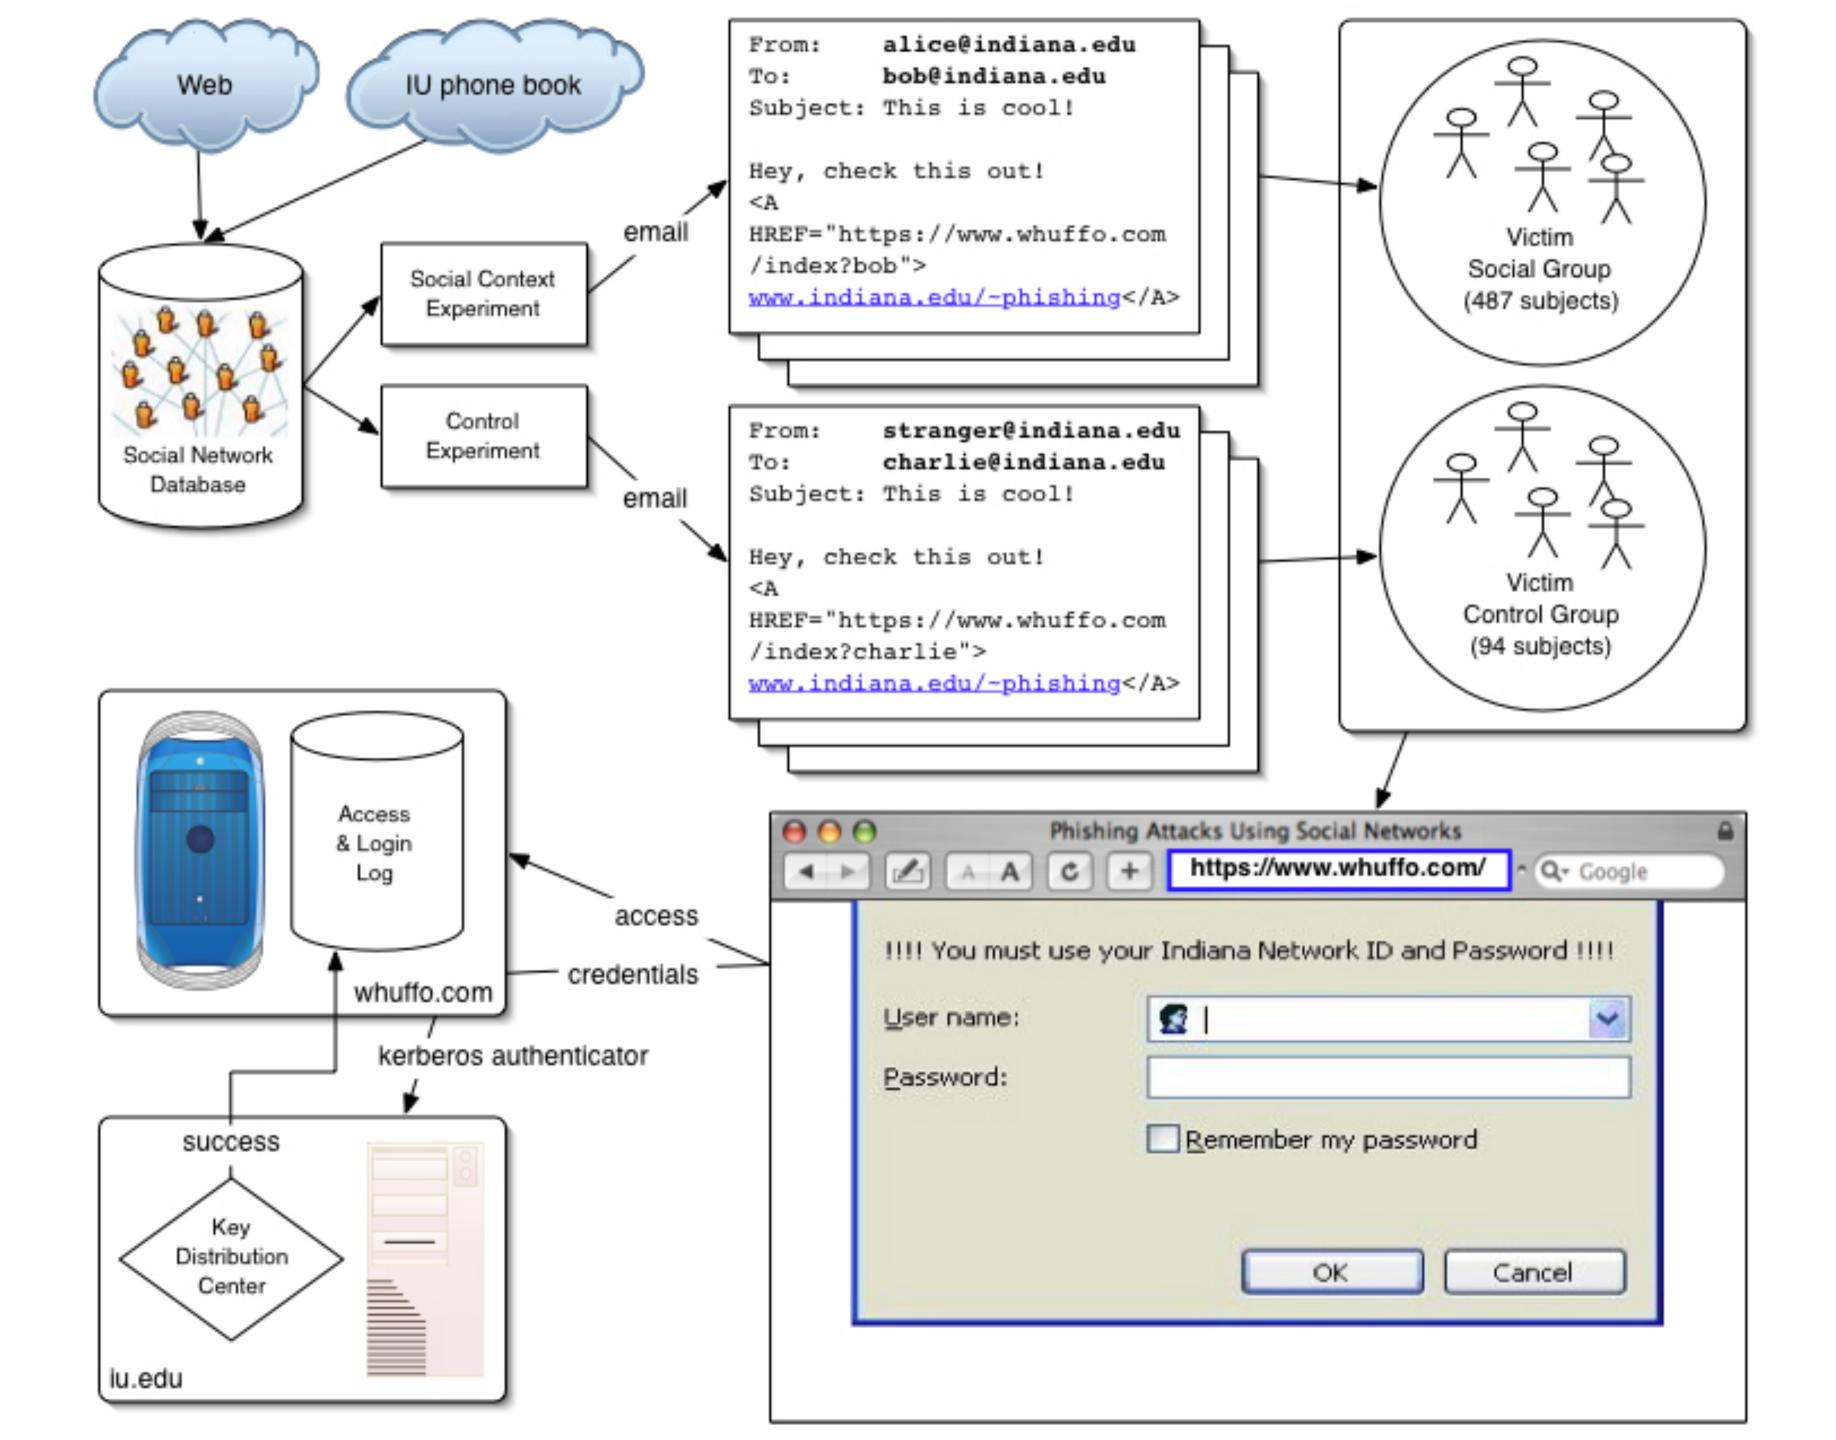

Simple Phishing

Lure: A spammed email with a call to action from a seemingly legitimate source encouraging the user to visit a hook website.

Hook: A website designed to mimic legitimate site and collect confidential information.

Spear Phishing @ IU

Experiment by T. Jagatic, N. Johnson, M. Jakobsson, F. Menczer.

Control Phishing Success Rate:

9-23%

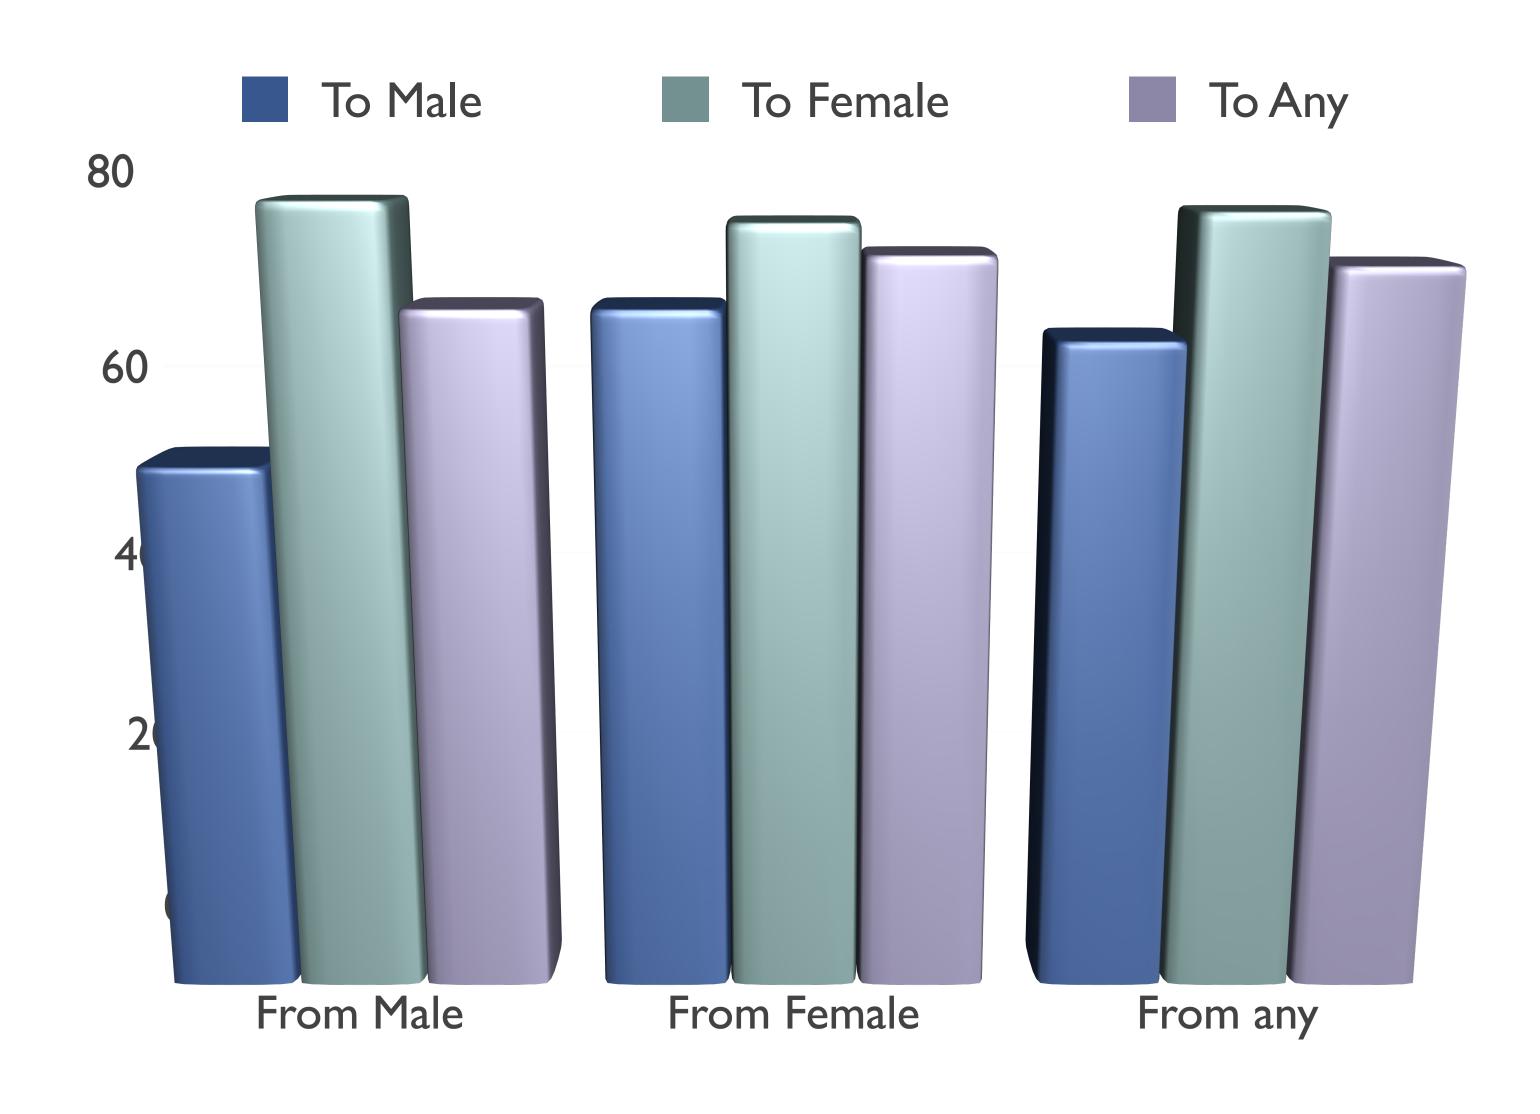

with 95% Confidence Interval

Spear Phishing Success Rate:

with 95% Confidence Interval

Spear Phishing Success Rate by Gender

VOIP Phishing

Lure: Get victim to call a bogus 800... number about their account.

Hook: Have the human on the other end extract the victim's information.

Future without passwords?

Authentication Protocols

Unix, PAM, and crypt

Network Information Service (NIS, aka Yellow Pages)

Needham-Schroeder and Kerberos

Status Check

- At this point, we have discussed:
 - How to securely store passwords
 - Techniques used by attackers to crack passwords
 - Biometrics and 2nd factors

Status Check

- At this point, we have discussed:
 - How to securely store passwords
 - Techniques used by attackers to crack passwords
 - Biometrics and 2nd factors
- Next topic: building authentication systems
 - Given a user and password, how does the system authenticate the user?
 - How can we perform efficient, secure authentication in a distributed system?

Building authentication systems

Example PAM Configuration

```
# cat /etc/pam.d/system-auth
#%PAM-1.0
auth required pam_unix.so try_first_pa

    Use SHA512 as the hash function

auth optional pam_permit.so
auth required pam_env.so

    Use /etc/shadow for storage

account required pam_unix.so
account optional pam_permit.so
account required pam_time.so
password required pam_unix.so try_first_pass nullok sha512 shadow
password optional pam_permit.so
session required pam_limits.so
session required pam_unix.so
session optional pam_permit.so
```

Unix Passwords

- Traditional method: crypt
 - 25 iterations of DES on a zeroed vector
 - First eight bytes of password used as key (additional bytes are ignored)
 - 12-bit salt
- Modern version of *crypt* are more extensible
 - Support for additional hash functions like MD5, SHA256, and SHA512
 - Key lengthening: defaults to 5000 iterations, up to $10^8 1$
 - Full password used
 - Up to 16 bytes of salt

Password Files

- Password hashes used to be in /etc/passwd
 - World readable, contained usernames, password hashes, config information
 - Many programs read config info from the file...
 - But very few (only one?) need the password hashes

Password Files

- Password hashes used to be in /etc/passwd
 - World readable, contained usernames, password hashes, config information
 - Many programs read config info from the file...
 - But very few (only one?) need the password hashes
- Turns out, world-readable hashes are Bad Idea
- Hashes now located in /etc/shadow
 - Also includes account metadata like expiration
 - Only visible to root

Password Storage on Linux

/etc/passwd
