# Linkage attack (Sweeney '97)

## MA Group Insurance Commission

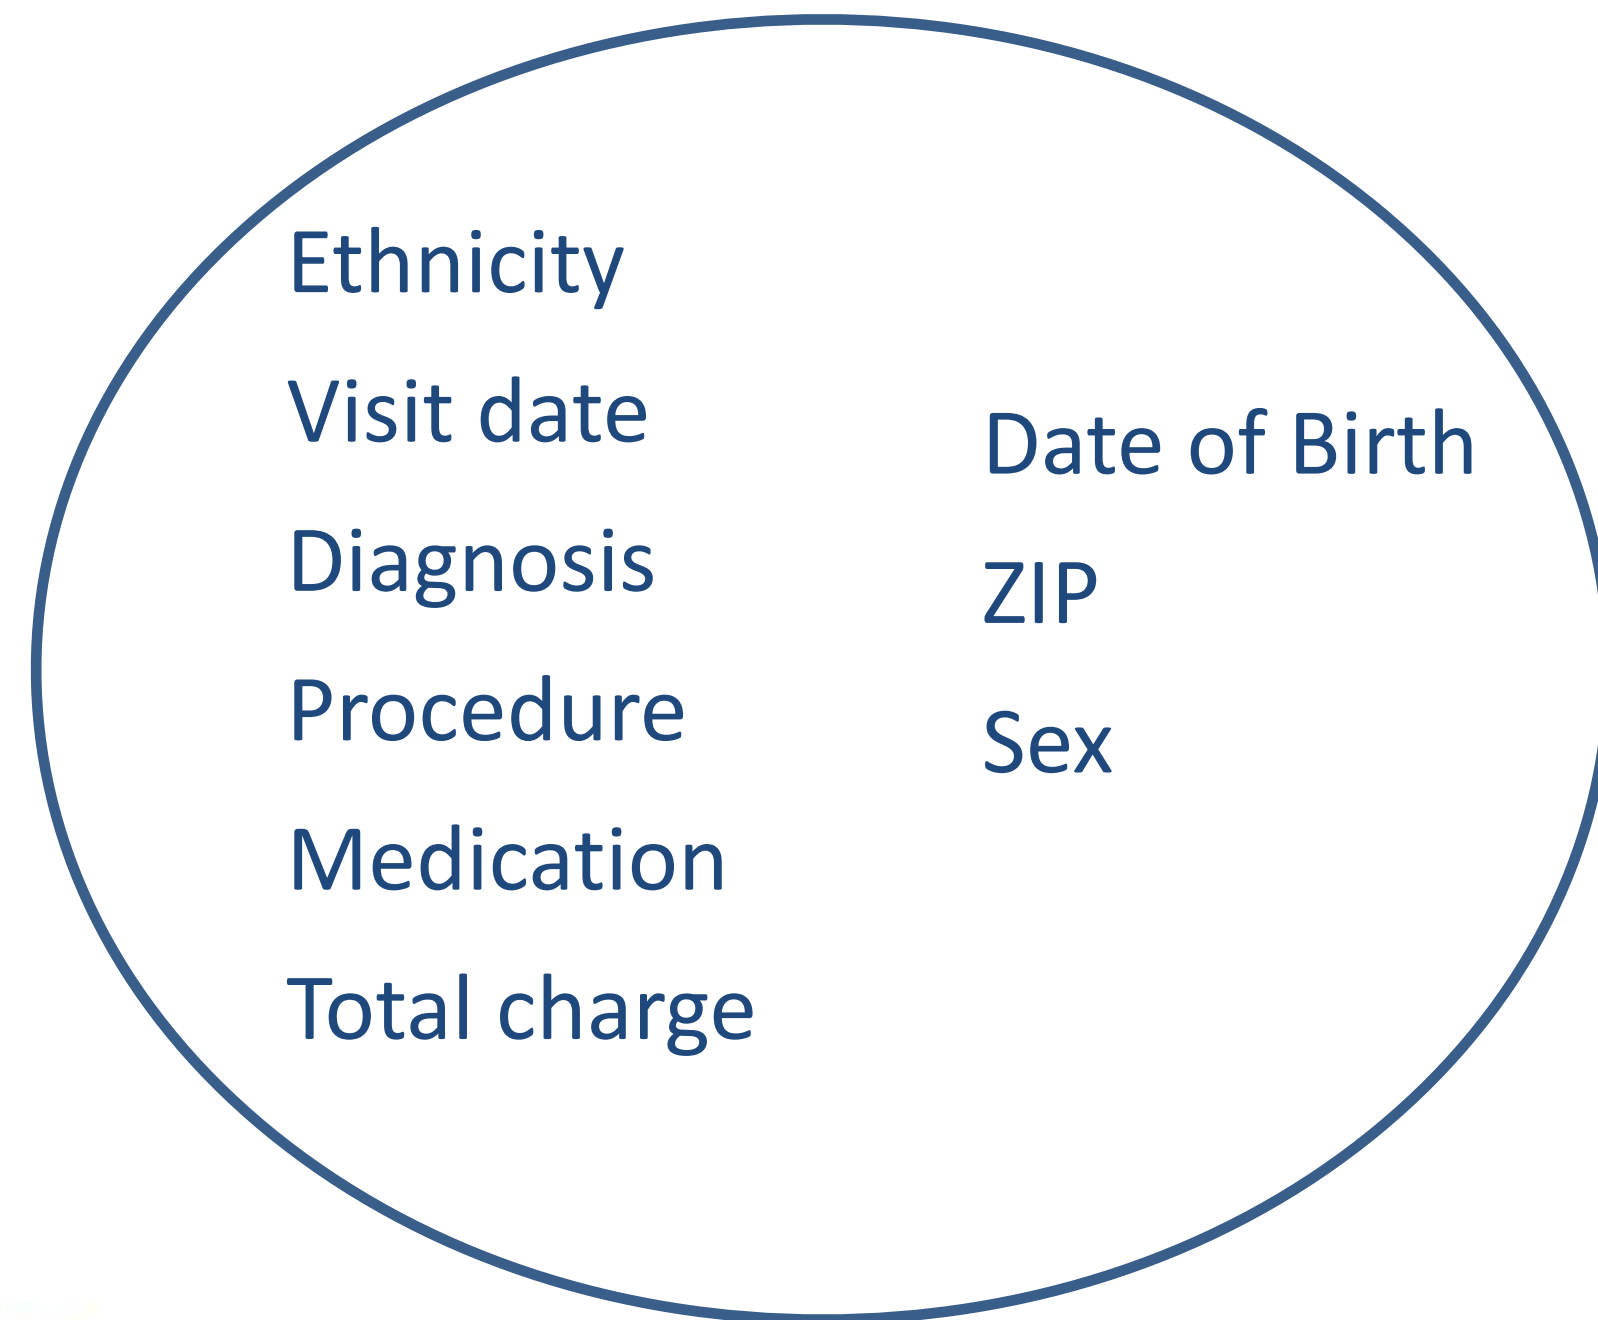

- Contained ~135,000 patients
- Anonymized: Name, SSN removed

## Voters registration of Cambridge MA

- Public information

Auxiliary  
information

# Linkage attack (Sweeney '97)

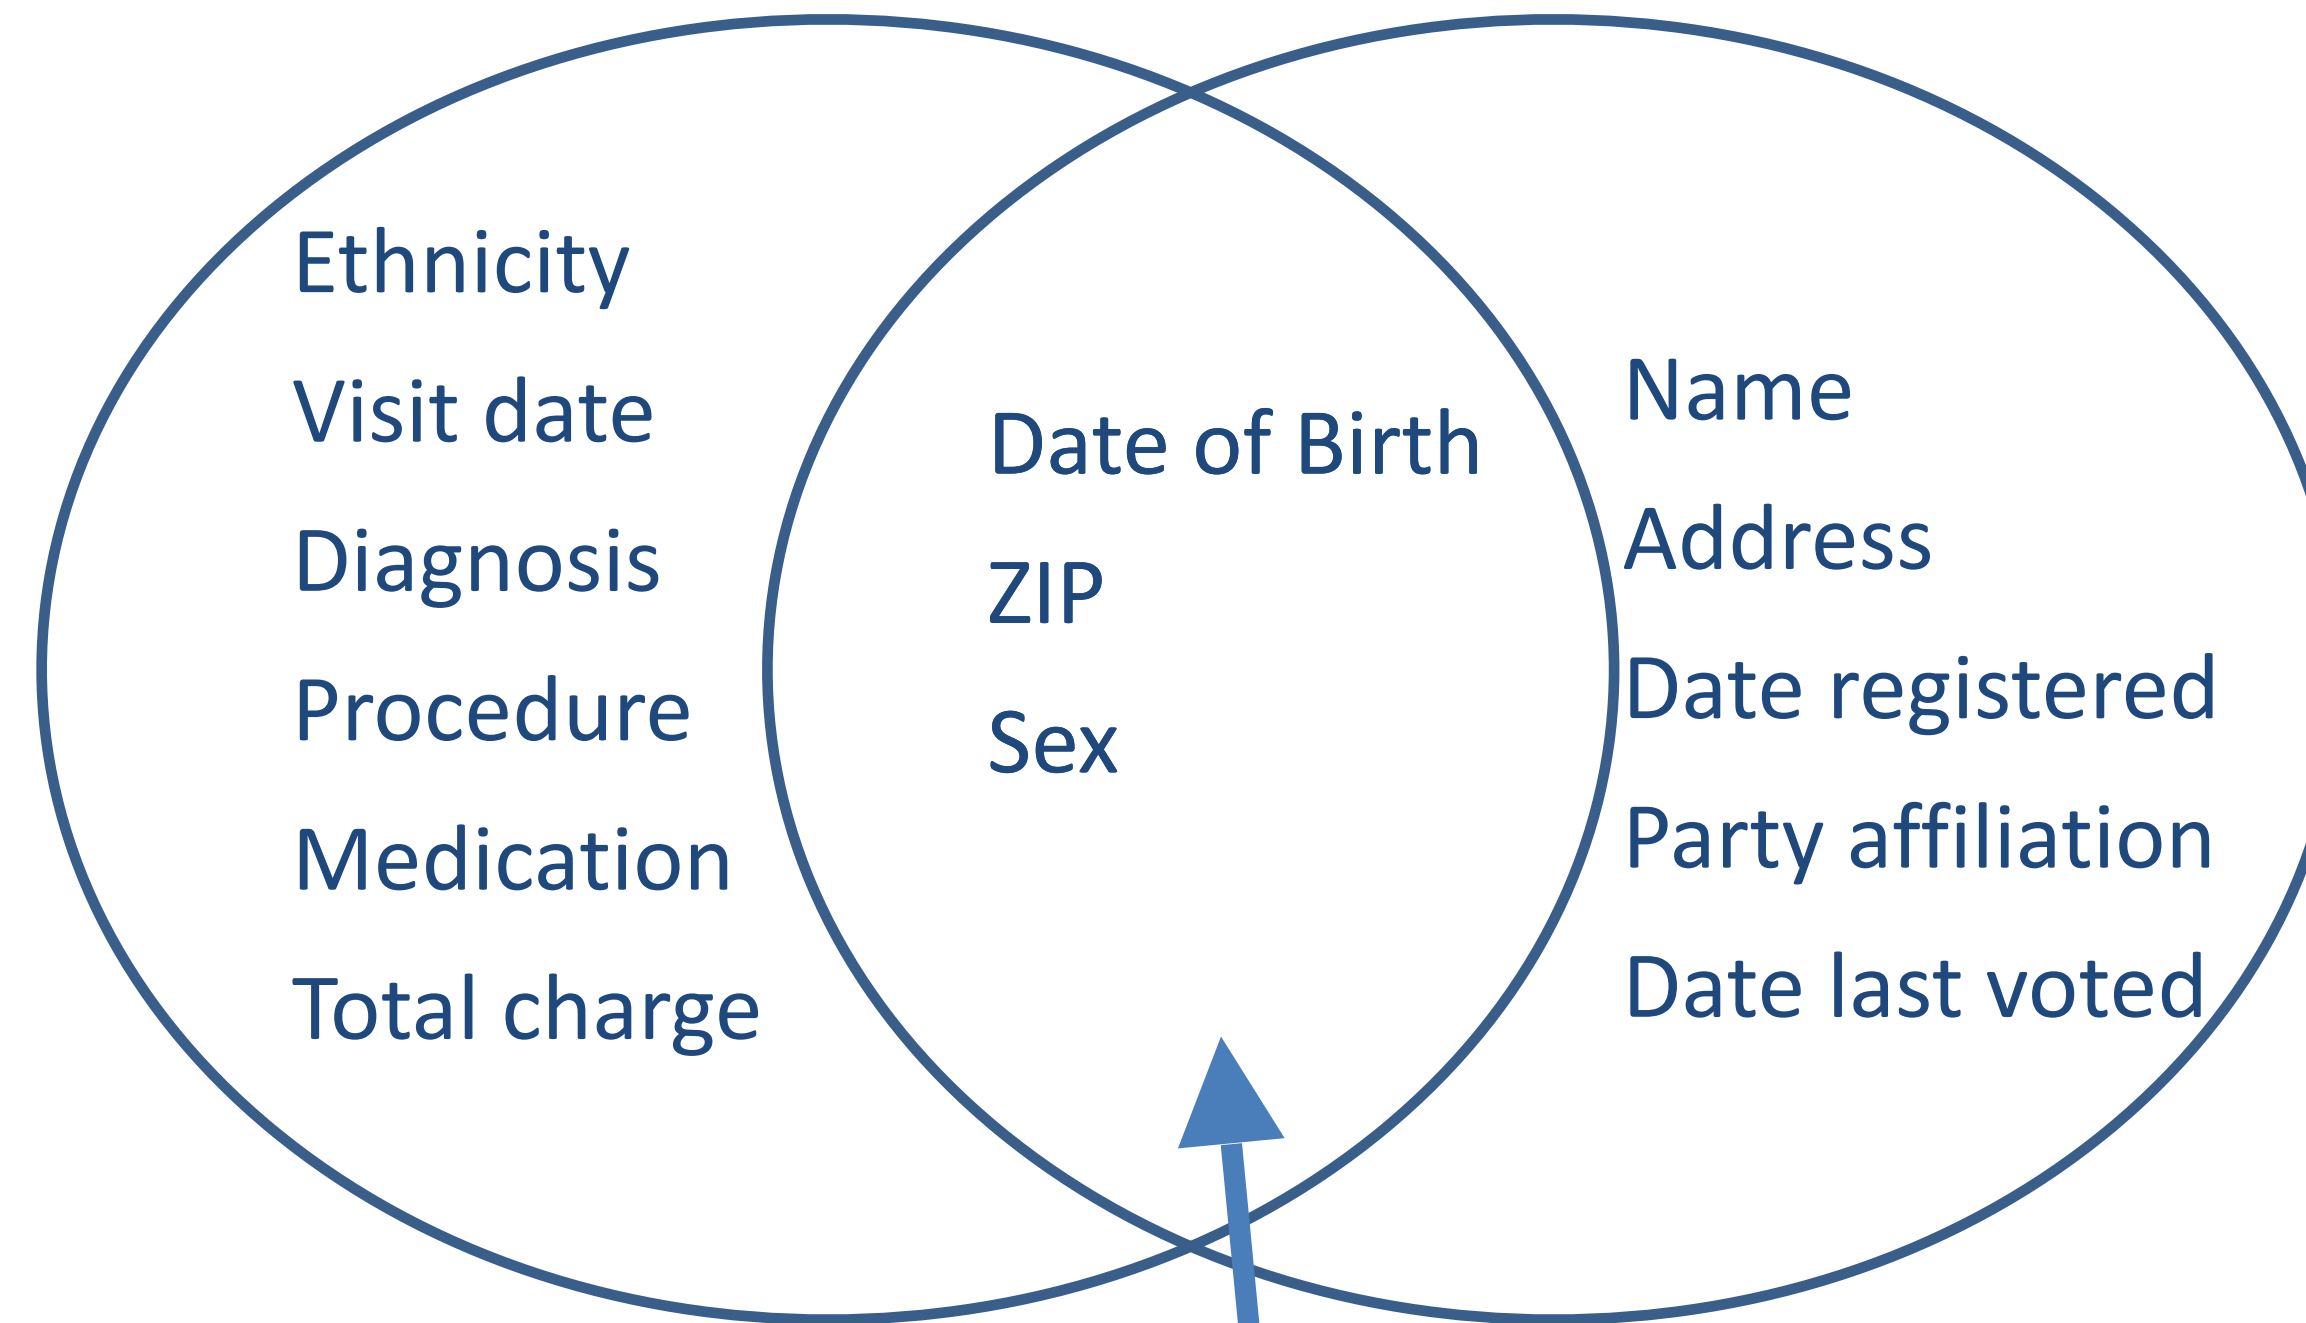

- A unique record fully de-anonymize the record
- (DoB, ZIP, Sex) uniquely identifies 87% of US population

# Linkage attack (Sweeney '97)

- A unique record fully de-anonymize the record
- (DoB, ZIP, Sex) uniquely identifies 87% of US population

# Linkage attack (Sweeney '97)

- A unique record fully de-anonymize the record
- (DoB, ZIP, Sex) uniquely identifies 87% of US population
- Re-identified medical records of William Weld (MA governor at the time)
- In Cambridge voters list
  - Six people shared his DoB
  - Three of which were men
  - He was the only one in his ZIP code
- Significant impact on privacy policymaking and the health privacy legislation HIPAA (Health Insurance Portability and Accountability Act)

## ***A Face Is Exposed for AOL Searcher***

### ***No. 4417749***

By Michael Barbaro and Tom Zeller Jr.

Buried in a list of 20 million Web search queries collected by AOL and recently released on the Internet is user No. 4417749. The number was assigned by the company to protect the searcher's anonymity, but it was not much of a shield.

## IMDb Datasets

Subsets of IMDb data are available for access to customers for personal and non-commercial use. You can hold local copies of this data, and it is subject to our terms and conditions. Please refer to the [Non-Commercial Licensing](#) and [copyright/license](#) and verify compliance.

### Data Location

The dataset files can be accessed and downloaded from <https://datasets.imdbws.com/>. The data is refreshed daily.

### IMDb Dataset Details

Each dataset is contained in a gzipped, tab-separated-values (TSV) formatted file in the UTF-8 character set. The first line in each file contains headers that describe what is in each column. A '\N' is used to denote that a particular field is missing or null for that title/name. The available datasets are as follows:

# Netflix Prize (2006)

# Netflix Prize (2006)

- **Sparse data cannot be anonymized!**

# Netflix Prize (2006)

- **Sparse data cannot be anonymized!**

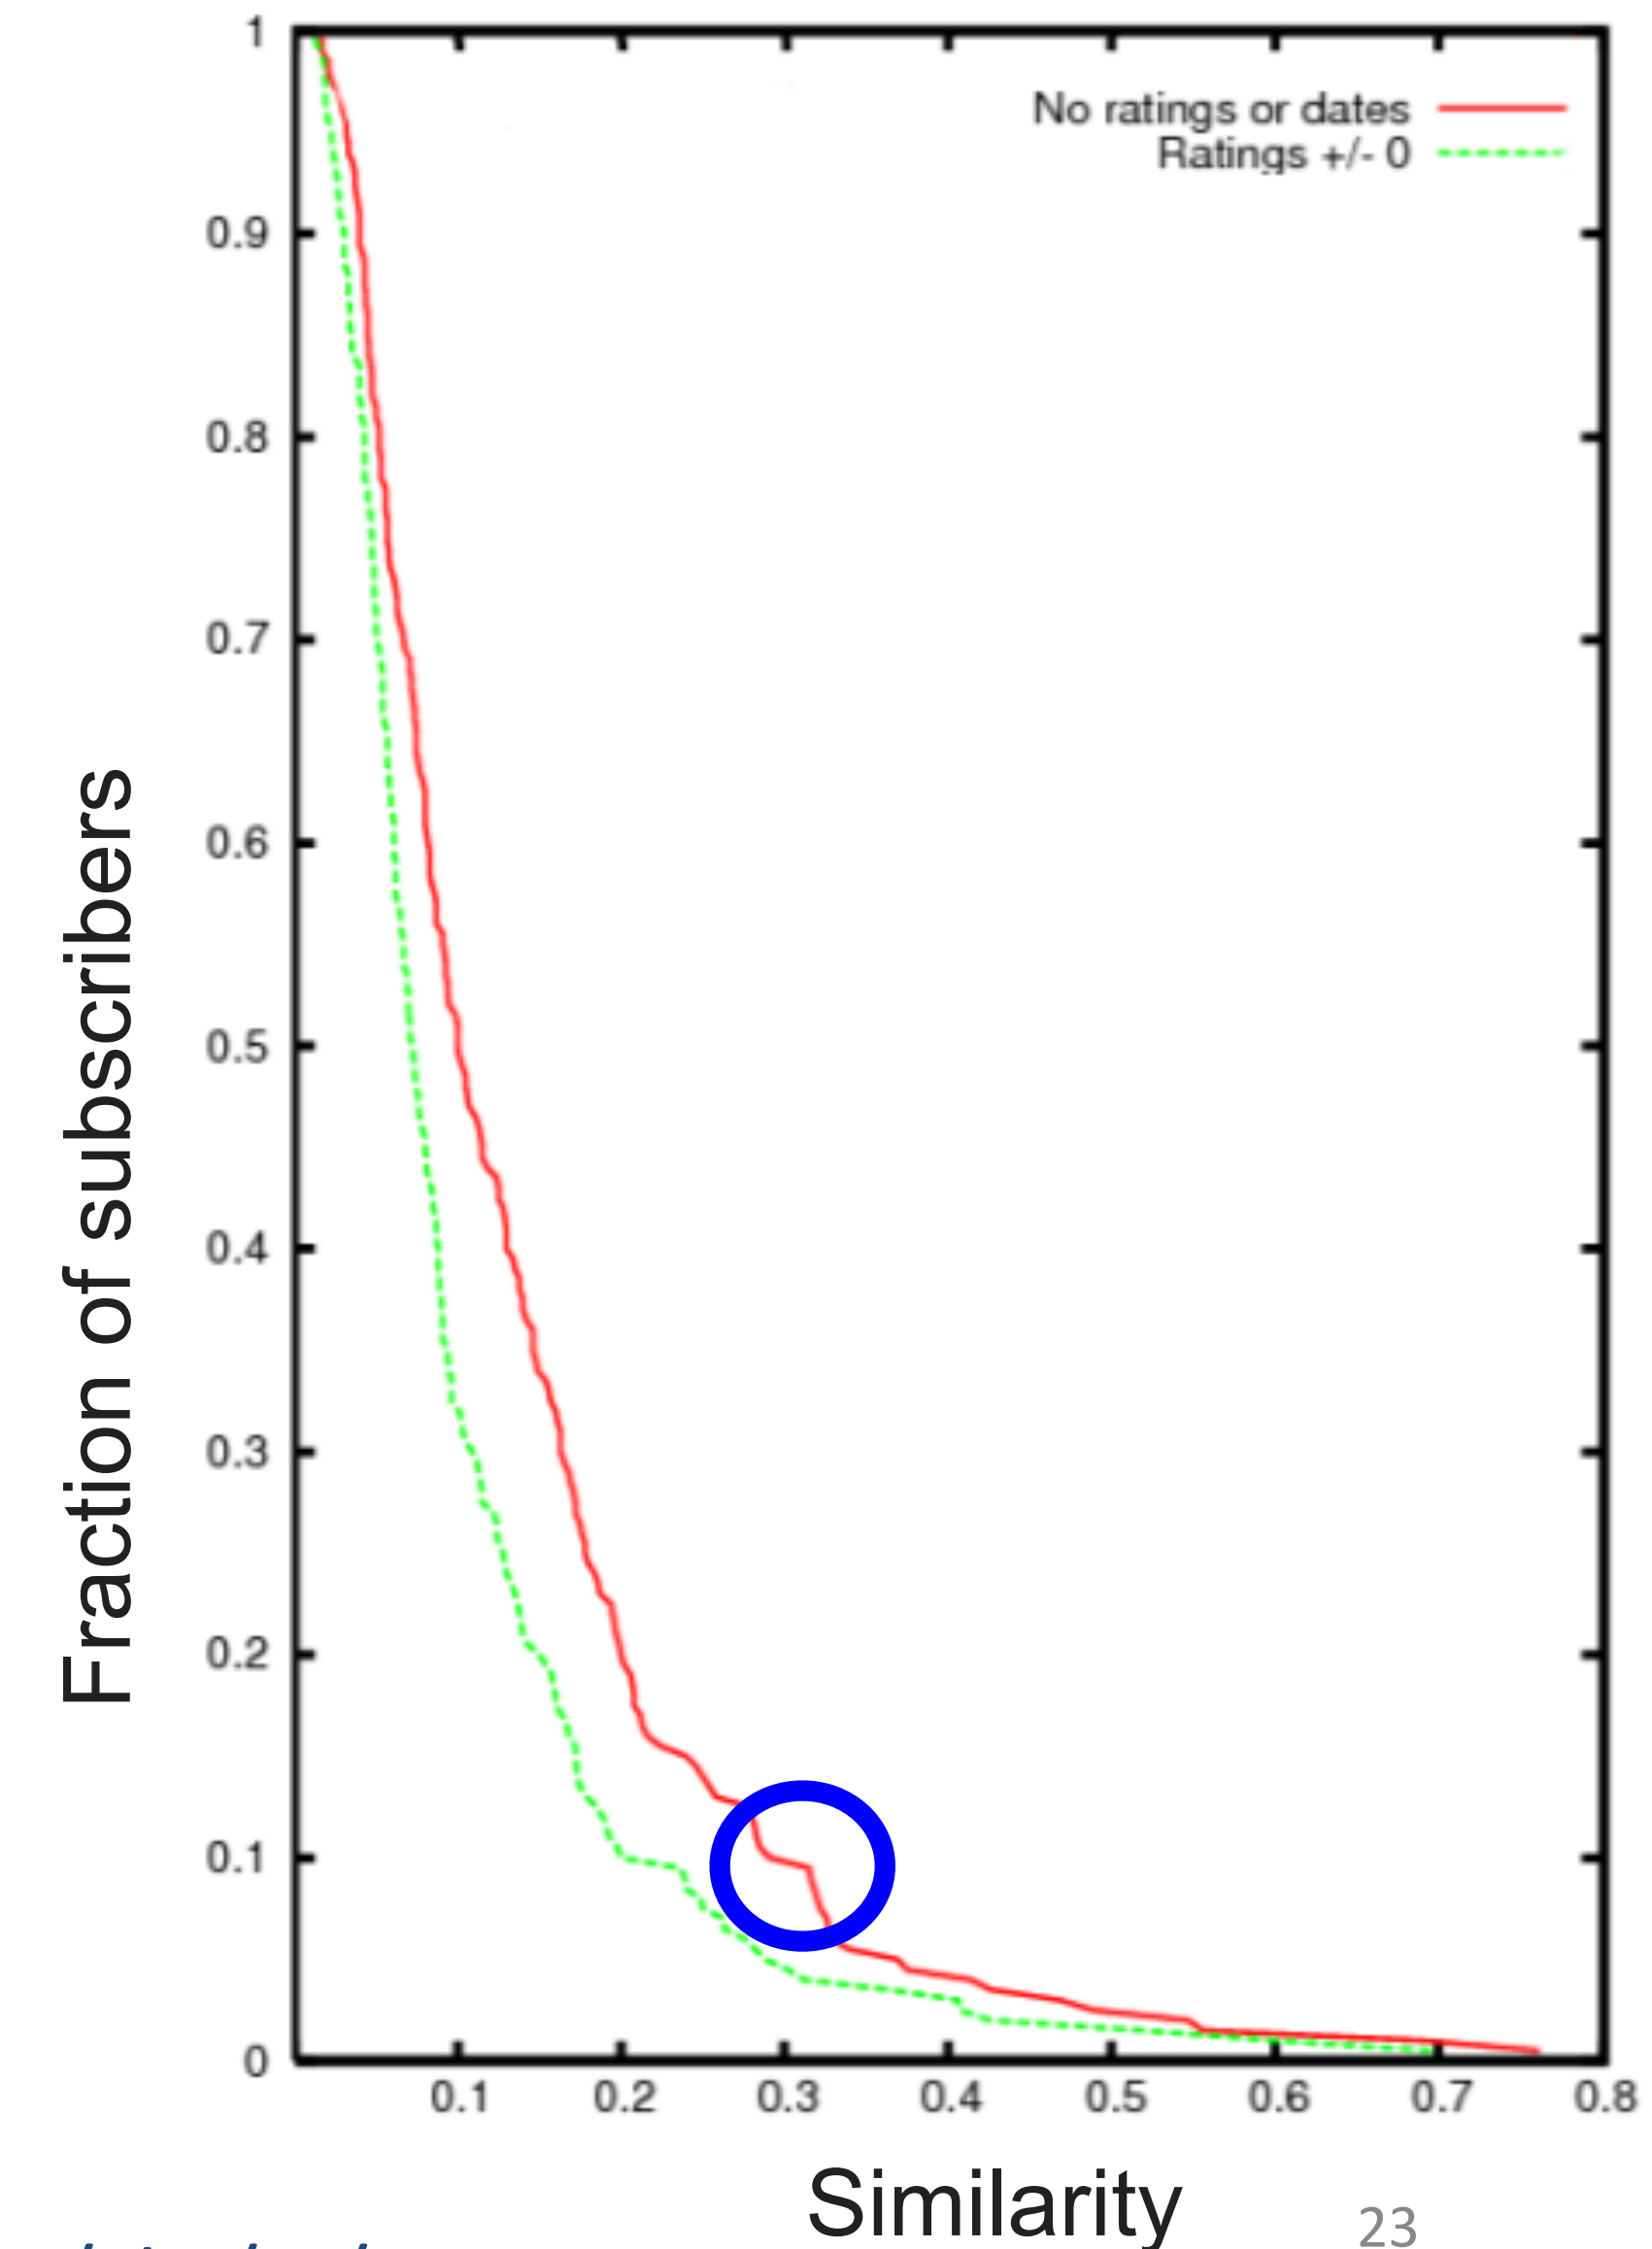

# Netflix Prize (2006)

- **Sparse data cannot be anonymized!**
- Considering just watch/didn't watch for 90% of the records there isn't a **single** other record which is more than 30% similar

# Netflix Prize (2006)

- **Sparse data cannot be anonymized!**
- Considering just watch/didn't watch for 90% of the records there isn't a **single** other record which is more than 30% similar
- Focus on movies that are not in top 10,000

# Netflix Prize (2006)

- **Sparse data cannot be anonymized!**
- Considering just watch/didn't watch for 90% of the records there isn't a **single** other record which is more than 30% similar
- Focus on movies that are not in top 10,000
- The whole point of privacy is that my record is similar to other records

# Netflix Prize (2006)

- **Sparse data cannot be anonymized!**
- Considering just watch/didn't watch for 90% of the records there isn't a **single** other record which is more than 30% similar
- Focus on movies that are not in top 10,000
- The whole point of privacy is that my record is similar to other records
- Here, to make two records "close" the data is destroyed

# Class exercise

This work was performed using an anonymized mobile phone dataset that contains call information for ~1.5 M users of a mobile phone operator. The data collection took place from April 2006 to June 2007 in a western country. Each time a user interacts with the mobile phone operator network by initiating or receiving a call or a text message, the location of the connecting antenna is recorded [Fig. 1A]. The dataset's intrinsic spatial resolution is thus the maximal half-distance between antennas. The dataset's intrinsic temporal resolution is one hour [Fig. 1B].

...

On average, 114 interactions per user per month for the nearly 6500 antennas are recorded. Antennas in our database are distributed throughout the country and serve, on average, ~ 2000 inhabitants each, covering areas ranging from 0.15 km<sup>2</sup> in cities to 15 km<sup>2</sup> in rural areas.

...

The considered dataset contains one trace  $T$  for each user. The traces spatio-temporal points contain the region in which the user was and the time of the interaction.

## Bin Ladin Determined To Strike in US

*Clandestine, foreign government, and media reports indicate Bin Ladin since 1997 has wanted to conduct terrorist attacks in the US. Bin Ladin implied in US television interviews in 1997 and 1998 that his followers would follow the example of World Trade Center bomber Ramzi Yousef and "bring the fighting to America."*

After US missile strikes on his base in Afghanistan in 1998, Bin Ladin told followers he wanted to retaliate in Washington, according to a [REDACTED] service.

An Egyptian Islamic Jihad (EIJ) operative told an [REDACTED] service at the same time that Bin Ladin was planning to exploit the operative's access to the US to mount a terrorist strike.

*The millennium plotting in Canada in 1998 may have been part of Bin Ladin's first serious attempt to implement a terrorist strike in the US. Convicted plotter Ahmed Ressam has told the FBI that he conceived the idea to attack Los Angeles International Airport himself, but that Bin Ladin lieutenant Abu Zubaydah encouraged him and helped facilitate the operation. Ressam also said that in 1998 Abu Zubaydah was planning his own US attack.*

Ressam says Bin Ladin was aware of the Los Angeles operation.

*Although Bin Ladin has not succeeded, his attacks against the US Embassies in Kenya and Tanzania in 1998 demonstrate that he prepares operations years in advance and is not deterred by setbacks. Bin Ladin associates surveilled our Embassies in Nairobi and Dar es Salaam as early as 1993, and some members of the Nairobi cell planning the bombings were arrested and deported in 1997.*

*Al-Qa'ida members—including some who are US citizens—have resided in or traveled to the US for years, and the group apparently maintains a support structure that could aid attacks. Two al-Qa'ida members found guilty in the conspiracy to bomb our Embassies in East Africa were US citizens, and a senior EIJ member lived in California in the mid-1990s.*

A clandestine source said in 1998 that a Bin Ladin cell in New York was recruiting Muslim-American youth for attacks.

*We have not been able to corroborate some of the more sensational threat reporting, such as that from a [REDACTED] service in 1998 saying that Bin Ladin wanted to hijack a US aircraft to gain the release of "Blind Shaykh" Umar 'Abd al-Rahman and other US-held extremists.*

Quiz: what does  $k$ -Anonymity provide

# Quiz: what does k-Anonymity provide

- Membership disclosure:  
attacker cannot tell that a given person is in the dataset

# Quiz: what does k-Anonymity provide

- Membership discloser:  
attacker cannot tell that a given person is in the dataset
- Sensitive attribute discloser:  
attacker cannot tell that a given person has a certain sensitive attribute

# Quiz: what does k-Anonymity provide

- Membership discloser:  
attacker cannot tell that a given person is in the dataset
- Sensitive attribute discloser:  
attacker cannot tell that a given person has a certain sensitive attribute
- Identity discloser:  
attacker cannot tell which record corresponds to which person

# Quiz: what does k-Anonymity provide

- Membership discloser:  
attacker cannot tell that a given person is in the dataset
- Sensitive attribute discloser:  
attacker cannot tell that a given person has a certain sensitive attribute
- Identity discloser:  
attacker cannot tell which record corresponds to which person

This interpretation is correct,  
assuming the attacker does not know anything other than quasi-identifiers

Popular idea #3: just add noise

# Popular idea #3: just add noise

- Mask numbers by adding a random number between  $[-a, a]$ 
  - Privacy  $2a$  @ 100% confidence, Privacy  $a$  @ 50% confidence, ...

# Popular idea #3: just add noise

- Mask numbers by adding a random number between  $[-a, a]$ 
  - Privacy  $2a$  @ 100% confidence, Privacy  $a$  @ 50% confidence, ...
- The larger the interval the better the privacy

# Popular idea #3: just add noise

- Mask numbers by adding a random number between  $[-a, a]$ 
  - Privacy  $2a$  @ 100% confidence, Privacy  $a$  @ 50% confidence, ...
- The larger the interval the better the privacy
- Example:
  - For each person mask age by adding a random number between  $[-100, 100]$
  - Gives privacy 200@100% confidence
  - But, masked age -99  $\Rightarrow$  a baby of age 0 or 1

A computation is “private” if whatever can be learned with my record in the DB can be learned without my record

# Differential Privacy

[Dwork, McSherry, Nissim, Smith 2006]

# Differential Privacy

[Dwork, McSherry, Nissim, Smith 2006]

A mechanism / algorithm / computation  $M$  has  **$\epsilon$ -differential privacy** if for any pair of neighboring databases  $D_1, D_2$  (differing by 1 record) and for any  $S \subseteq \text{Range}(M)$

# Differential Privacy

[Dwork, McSherry, Nissim, Smith 2006]

A mechanism / algorithm / computation  $M$  has  **$\epsilon$ -differential privacy** if for any pair of neighboring databases  $D_1, D_2$  (differing by 1 record) and for any  $S \subseteq \text{Range}(M)$

$$\Pr[M(D_1) \in S] \leq e^\epsilon \cdot \Pr[M(D_2) \in S]$$

# Differential Privacy

[Dwork, McSherry, Nissim, Smith 2006]

A mechanism / algorithm / computation  $M$  has  **$\epsilon$ -differential privacy** if for any pair of neighboring databases  $D_1, D_2$  (differing by 1 record) and for any  $S \subseteq \text{Range}(M)$

$$\Pr[M(D_1) \in S] \leq e^\epsilon \cdot \Pr[M(D_2) \in S]$$
